This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

 1 Introduction	
About Oracle Database Developers.....	1-1
About This Document	1-1
About Oracle Database	1-2
About Schema Objects.....	1-2
About Oracle Database Access.....	1-3
About SQL*Plus	1-4
About SQL Developer	1-4
About Structured Query Language (SQL)	1-4
About Procedural Language/SQL (PL/SQL)	1-5
About Other Client Programs, Languages, and Development Tools	1-5
About Sample Schema HR	1-9
 2 Connecting to Oracle Database	
Connecting to Oracle Database from SQL*Plus	2-1
Connecting to Oracle Database from SQL Developer	2-2
Connecting to Oracle Database as User HR.....	2-4
Unlocking the HR Account.....	2-4
Connecting to Oracle Database as User HR from SQL*Plus	2-5
Connecting to Oracle Database as User HR from SQL Developer	2-6
 3 Exploring Oracle Database with SQL Developer	
Tutorial: Viewing HR Schema Objects.....	3-1
Tutorial: Viewing EMPLOYEES Table Properties and Data.....	3-2
 4 Selecting Table Data	
About Queries	4-1

Running Queries in SQL Developer	4-2
Tutorial: Selecting All Columns of a Table	4-3
Tutorial: Selecting Specific Columns of a Table	4-3
Displaying Selected Columns Under New Headings	4-4
Selecting Data that Satisfies Specified Conditions	4-5
Specifying Conditions with Regular Expressions	4-7
Sorting Selected Data	4-11
Selecting Data from Multiple Tables	4-13
Using Operators and Functions in Queries	4-14
Using Arithmetic Operators in Queries	4-14
Using Numeric Functions in Queries	4-15
Using the Concatenation Operator in Queries	4-16
Using Character Functions in Queries	4-16
Using Datetime Functions in Queries	4-19
Using Conversion Functions in Queries	4-22
Using Aggregate Functions in Queries	4-24
Using NULL-Related Functions in Queries	4-28
Using CASE Expressions in Queries	4-29
Using the DECODE Function in Queries	4-30

5 About DML Statements and Transactions

About Data Manipulation Language (DML) Statements	5-1
About the INSERT Statement	5-2
About the UPDATE Statement	5-4
About the DELETE Statement	5-5
About Transaction Control Statements	5-5
Committing Transactions	5-6
Rolling Back Transactions	5-8
Setting Savepoints in Transactions	5-10

6 Creating and Managing Schema Objects

About Data Definition Language (DDL) Statements	6-1
About Schema Object Names	6-2
Creating and Managing Tables	6-2
About SQL Data Types	6-2
Creating Tables	6-3
Tutorial: Creating a Table with the Create Table Tool	6-3
Creating Tables with the CREATE TABLE Statement	6-4
Ensuring Data Integrity in Tables	6-5
About Constraint Types	6-5
Tutorial: Adding Constraints to Existing Tables	6-6
Tutorial: Adding Rows to Tables with the Insert Row Tool	6-11
Tutorial: Changing Data in Tables in the Data Pane	6-12
Tutorial: Deleting Rows from Tables with the Delete Selected Row(s) Tool	6-13
Managing Indexes	6-14
Tutorial: Adding an Index with the Create Index Tool	6-14
Tutorial: Changing an Index with the Edit Index Tool	6-15

Tutorial: Dropping an Index	6-15
Dropping Tables.....	6-16
Creating and Managing Views	6-17
Creating Views	6-17
Tutorial: Creating a View with the Create View Tool.....	6-17
Creating Views with the CREATE VIEW Statement	6-18
Tutorial: Changing Views with the Edit View and Rename Tools.....	6-18
Dropping Views	6-20
Creating and Managing Sequences	6-20
Tutorial: Creating a Sequence	6-21
Dropping Sequences	6-22
Creating and Managing Synonyms	6-22
Creating Synonyms.....	6-23
Dropping Synonyms.....	6-24

7 Developing Stored Subprograms and Packages

About Stored Subprograms.....	7-1
About Packages.....	7-2
About PL/SQL Identifiers.....	7-3
About PL/SQL Data Types	7-4
Creating and Managing Standalone Stored Subprograms	7-4
About Subprogram Structure.....	7-5
Tutorial: Creating a Standalone Stored Procedure.....	7-6
Tutorial: Creating a Standalone Stored Function	7-8
Changing Standalone Stored Subprograms.....	7-9
Tutorial: Testing a Standalone Stored Function	7-10
Dropping Standalone Stored Subprograms	7-11
Creating and Managing Packages.....	7-11
About Package Structure.....	7-12
Tutorial: Creating a Package Specification	7-12
Tutorial: Changing a Package Specification.....	7-13
Tutorial: Creating a Package Body	7-14
Dropping a Package.....	7-15
Declaring and Assigning Values to Variables and Constants	7-15
Tutorial: Declaring Variables and Constants in a Subprogram	7-16
Ensuring that Variables, Constants, and Parameters Have Correct Data Types.....	7-17
Tutorial: Changing Declarations to Use the %TYPE Attribute	7-18
Assigning Values to Variables.....	7-19
Assigning Values to Variables with the Assignment Operator	7-20
Assigning Values to Variables with the SELECT INTO Statement	7-21
Controlling Program Flow	7-22
About Control Statements	7-22
Using the IF Statement	7-23
Using the CASE Statement	7-24
Using the FOR LOOP Statement.....	7-25
Using the WHILE LOOP Statement	7-27
Using the Basic LOOP and EXIT WHEN Statements	7-28

Using Records and Cursors	7-30
About Records	7-30
Tutorial: Declaring a RECORD Type	7-31
Tutorial: Creating and Invoking a Subprogram with a Record Parameter	7-32
About Cursors	7-34
Using an Explicit Cursor to Retrieve Result Set Rows One at a Time.....	7-35
Tutorial: Using an Explicit Cursor to Retrieve Result Set Rows One at a Time	7-36
About Cursor Variables.....	7-37
Using a Cursor Variable to Retrieve Result Set Rows One at a Time.....	7-38
Tutorial: Using a Cursor Variable to Retrieve Result Set Rows One at a Time	7-39
Using Associative Arrays	7-41
About Collections.....	7-42
About Associative Arrays	7-42
Declaring Associative Arrays.....	7-43
Populating Associative Arrays.....	7-44
Traversing Dense Associative Arrays	7-46
Traversing Sparse Associative Arrays	7-47
Handling Exceptions (Run-Time Errors)	7-48
About Exceptions and Exception Handlers	7-48
Handling Predefined Exceptions	7-49
Declaring and Handling User-Defined Exceptions.....	7-50

8 Using Triggers

About Triggers	8-1
Creating Triggers.....	8-2
About OLD and NEW Pseudorecords	8-3
Tutorial: Creating a Trigger that Logs Table Changes	8-3
Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted ...	8-4
Creating an INSTEAD OF Trigger.....	8-5
Creating Triggers that Log LOGON and LOGOFF Events.....	8-6
Changing Triggers.....	8-7
Disabling and Enabling Triggers.....	8-7
About Trigger Compilation and Dependencies.....	8-8
Dropping Triggers.....	8-8

9 Working in a Global Environment

About Globalization Support Features	9-1
About Language Support.....	9-2
About Territory Support	9-2
About Date and Time Formats.....	9-2
About Calendar Formats.....	9-3
About Numeric and Monetary Formats	9-4
About Linguistic Sorting and String Searching	9-4
About Length Semantics	9-4
About Unicode and SQL National Character Data Types	9-5
About Initial NLS Parameter Values.....	9-5
Viewing NLS Parameter Values.....	9-6

Changing NLS Parameter Values	9-7
Changing NLS Parameter Values for All SQL Developer Connections	9-8
Changing NLS Parameter Values for the Current SQL Function Invocation	9-8
About Individual NLS Parameters	9-9
About Locale and the NLS_LANG Parameter.....	9-10
About the NLS_LANGUAGE Parameter	9-10
About the NLS_TERRITORY Parameter	9-12
About the NLS_DATE_FORMAT Parameter	9-14
About the NLS_DATE_LANGUAGE Parameter	9-16
About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters	9-17
About the NLS_CALENDAR Parameter.....	9-18
About the NLS_NUMERIC_CHARACTERS Parameter.....	9-19
About the NLS_CURRENCY Parameter	9-20
About the NLS_ISO_CURRENCY Parameter.....	9-21
About the NLS_DUAL_CURRENCY Parameter	9-23
About the NLS_SORT Parameter	9-23
About the NLS_COMP Parameter.....	9-24
About the NLS_LENGTH_SEMANTICS Parameter	9-26
Using Unicode in Globalized Applications	9-27
Representing Unicode String Literals in SQL and PL/SQL	9-27
Avoiding Data Loss During Character-Set Conversion	9-28

10 Deploying an Oracle Database Application

About Deployment Environments	10-1
About Installation Script Files	10-1
About DDL Statements and Schema Object Dependencies.....	10-2
About INSERT Statements and Constraints.....	10-2
Creating Installation Script Files	10-3
Creating an Installation Script File with SQL Developer	10-4
Editing Installation Script Files that Create Sequences	10-5
Editing Installation Script Files that Create Triggers.....	10-6
Tutorial: Creating an Installation Script File for the Sequence and Tables	10-6
Tutorial: Creating an Installation Script File for the Package.....	10-8
Tutorial: Creating an Installation Script File for the Synonym and View	10-9
Tutorial: Creating an Installation Script File for the Data	10-11
Installing the Sample Application	10-12
Checking the Validity of an Installation	10-13
Archiving the Installation Script Files	10-14

Index

List of Examples

2-1	Connecting to Oracle Database from SQL*Plus	2-2
4-1	Displaying Selected Columns Under New Headings	4-4
4-2	Preserving Case and Including Spaces in Column Aliases	4-4
4-3	Selecting Data from One Department.....	4-5
4-4	Selecting Data from Specified Departments	4-5
4-5	Selecting Data for Last Names that Start with the Same Substring.....	4-6
4-6	Selecting Data for Last Names that Include the Same Substring.....	4-6
4-7	Selecting Data that Satisfies Two Conditions	4-6
4-8	Selecting All Managers in the EMPLOYEES Table.....	4-7
4-9	Selecting All Employees Whose Last Names Have Double Vowels.....	4-8
4-10	Displaying Phone Numbers in a Different Format.....	4-8
4-11	Extracting the Street Number from Each STREET_ADDRESS	4-9
4-12	Counting the Number of Spaces in Each STREET_ADDRESS.....	4-9
4-13	Reporting the Position of the First Space in Each STREET_ADDRESS	4-10
4-14	Sorting Selected Data by LAST_NAME	4-11
4-15	Sorting Selected Data by an Unselected Column.....	4-12
4-16	Selecting Data from Two Tables (Joining Two Tables)	4-13
4-17	Using an Arithmetic Expression in a Query	4-14
4-18	Rounding Numeric Data.....	4-15
4-19	Truncating Numeric Data.....	4-15
4-20	Concatenating Character Data	4-16
4-21	Changing the Case of Character Data.....	4-16
4-22	Trimming Character Data.....	4-17
4-23	Padding Character Data.....	4-17
4-24	Extracting Substrings from Character Data	4-18
4-25	Replacing Substrings in Character Data.....	4-18
4-26	Displaying the Number of Months Between Dates	4-20
4-27	Displaying the Number of Years Between Dates.....	4-20
4-28	Displaying the Last Day of a Selected Month.....	4-21
4-29	Displaying a Date Six Months from a Selected Date	4-21
4-30	Displaying System Date and Time	4-22
4-31	Converting Dates to Characters Using a Format Template.....	4-22
4-32	Converting Dates to Characters Using Standard Formats.....	4-23
4-33	Converting Numbers to Characters Using a Format Template	4-23
4-34	Converting Characters to Numbers	4-23
4-35	Converting a Character String to a Date.....	4-24
4-36	Converting a Character String to a Time Stamp	4-24
4-37	Counting the Number of Rows in Each Group	4-25
4-38	Counting the Number of Distinct Values in a Set.....	4-26
4-39	Using Aggregate Functions for Statistical Information.....	4-26
4-40	Limiting Aggregate Functions to Rows that Satisfy a Condition	4-27
4-41	Showing the Rank and Percentile of a Number Within a Group	4-27
4-42	Showing the Dense Rank of a Number Within a Group.....	4-27
4-43	Substituting a String for a NULL Value	4-28
4-44	Specifying Different Expressions for NULL and Not NULL Values	4-28
4-45	Using a CASE Expression in a Query	4-29
4-46	Using the DECODE Function in a Query	4-30
5-1	Using the INSERT Statement When All Information Is Available	5-2
5-2	Using the INSERT Statement When Not All Information Is Available	5-3
5-3	Using the INSERT Statement Incorrectly	5-3
5-4	Using the UPDATE Statement to Add Data	5-4
5-5	Using the UPDATE Statement to Update Multiple Rows	5-5
5-6	Using the DELETE Statement	5-5
5-7	Committing a Transaction	5-7

5-8	Rolling Back an Entire Transaction	5-8
5-9	Rolling Back a Transaction to a Savepoint	5-10
6-1	Creating the EVALUATIONS Table with CREATE TABLE	6-4
6-2	Creating the SCORES Table with CREATE TABLE.....	6-4
6-3	Creating the EMP_LOCATIONS View with CREATE VIEW	6-18
7-1	Assigning Values to a Variable with Assignment Operator	7-20
7-2	Assigning Table Values to Variables with SELECT INTO	7-21
7-3	Inserting a Table Row with Values from Another Table	7-21
7-4	IF Statement that Determines Return Value of Function.....	7-23
7-5	CASE Statement that Determines Which String to Print	7-24
7-6	FOR LOOP Statement that Computes Salary After Five Years.....	7-25
7-7	WHILE LOOP Statement that Computes Salary to Maximum.....	7-27
7-8	Using the EXIT WHEN Statement.....	7-28
7-9	Declaring Associative Arrays.....	7-44
7-10	Populating Associative Arrays	7-45
7-11	Traversing a Dense Associative Array.....	7-46
7-12	Traversing a Sparse Associative Array.....	7-47
7-13	Handling Predefined Exception NO_DATA_FOUND	7-49
7-14	Handling User-Defined Exceptions	7-50
8-1	Creating an INSTEAD OF Trigger	8-6
9-1	NLS_LANGUAGE Affects Server Message and Month Abbreviations	9-11
9-2	NLS_TERRITORY Affects Currency Symbol.....	9-13
9-3	NLS_TERRITORY Affects Date Formats.....	9-14
9-4	NLS_DATE_FORMAT Overrides NLS_TERRITORY	9-15
9-5	NLS_DATE_LANGUAGE Affects Displayed SYSDATE	9-16
9-6	NLS_CALENDAR Affects Displayed SYSDATE	9-18
9-7	NLS_NUMERIC_CHARACTERS Affects Decimal Character and Group Separator....	9-19
9-8	NLS_CURRENCY Overrides NLS_TERRITORY	9-20
9-9	NLS_ISO_CURRENCY	9-22
9-10	NLS_SORT Affects Linguistic Sort Order	9-23
9-11	NLS_COMP Affects SQL Character Comparison	9-25
9-12	NLS_LENGTH_SEMANTICS Affects Storage of VARCHAR2 Column.....	9-26

7-1	Cursor Attribute Values	7-34
9-1	Initial Values of NLS Parameters in SQL Developer	9-6

Preface

This document explains basic concepts behind application development with Oracle Database. It provides instructions for using the basic features of topics through Structured Query Language (SQL), and the Oracle server-based procedural extension to the SQL database language, Procedural Language/Structured Query Language (PL/SQL).

Preface topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

Audience

This document is intended for anyone who is interested in learning about Oracle Database application development, and is primarily an introduction to application development for developers who are new to Oracle Database.

This document assumes that you have a general understanding of relational database concepts and an understanding of the operating system environment that you will use to develop applications with Oracle Database.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Related Documents

As you become comfortable with the concepts and tasks in this document, Oracle recommends that you consult other Oracle Database development documents, especially:

- *Oracle Database 2 Day + Application Express Developer's Guide*
- *Oracle Database 2 Day + Java Developer's Guide*
- *Oracle Database 2 Day + .NET Developer's Guide*
- *Oracle Database 2 Day + PHP Developer's Guide*

For more information, see:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database PL/SQL Language Reference*

Conventions

This document uses these text conventions:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Introduction

This chapter contains the following topics:

- [About Oracle Database Developers](#)
- [About This Document](#)
- [About Oracle Database](#)
- [About Sample Schema HR](#)

About Oracle Database Developers

An Oracle Database developer is responsible for creating or maintaining the database components of an application that uses the Oracle technology stack. Oracle Database developers either develop applications or convert existing applications to run in the Oracle Database environment.

See Also: *Oracle Database Concepts* for more information about the duties of Oracle Database developers

About This Document

This document is the entry into the Oracle Database documentation set for application developers. It does the following:

- Explains the basic concepts behind development with Oracle Database
- Shows how to use basic features of SQL and PL/SQL
- Provides references to detailed information about subjects that it introduces
- Shows, with tutorials and examples, how to develop and deploy a sample application

[Chapter 1, "Introduction,"](#) describes the reader for whom this document is intended, outlines the organization of this document, introduces important Oracle Database concepts, and describes the sample schema used in the tutorials and examples in this document.

[Chapter 2, "Connecting to Oracle Database,"](#) explains how to connect to Oracle Database.

[Chapter 3, "Exploring Oracle Database with SQL Developer,"](#) shows how to view schema objects and the properties and data of Oracle Database tables.

[Chapter 4, "Selecting Table Data,"](#) shows how to use queries to retrieve data from an Oracle Database table.

[Chapter 5, "About DML Statements and Transactions,"](#) introduces data manipulation language (DML) statements and transactions. DML statements add, change, and delete Oracle Database table data. A transaction is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are.

[Chapter 6, "Creating and Managing Schema Objects,"](#) introduces data definition language (DDL) statements, which create, change, and drop schema objects. The tutorials and examples show how to create the objects for the sample application.

[Chapter 7, "Developing Stored Subprograms and Packages,"](#) introduces stored subprograms and packages, which can be used as building blocks for many different database applications. The tutorials and examples show how to create the package of subprograms for the sample application.

[Chapter 8, "Using Triggers,"](#) introduces triggers, which are stored PL/SQL units that automatically execute ("fire") in response to specified events. The tutorials and examples show how to create the triggers for the sample application.

[Chapter 9, "Working in a Global Environment,"](#) introduces globalization support—National Language Support (NLS) parameters and Unicode-related features of SQL and PL/SQL.

[Chapter 10, "Deploying an Oracle Database Application,"](#) explains how to deploy a database application—that is, how to install it in one or more environments where other users can run it—using the sample application as an example.

About Oracle Database

Oracle Database groups related information into logical structures called **schemas**. The logical structures are called **schema objects**. When you connect to the database by providing your user name and password, you specify the schema and indicate that you are its owner. In Oracle Database, the user name and the name of the schema to which the user connects are the same.

Topics:

- [About Schema Objects](#)
- [About Oracle Database Access](#)

About Schema Objects

Every object in an Oracle Database belongs to only one schema, and has a unique name with that schema.

Some of the objects that schemas can contain are:

- **Tables**

Tables are the basic units of data storage in Oracle Database. Tables hold all user-accessible data. Each table contains **rows** that represent individual data **records**. Rows are composed of **columns** that represent the **fields** of the records. For more information, see ["Creating and Managing Tables"](#) on page 6-2.

- **Indexes**

Indexes are optional objects that can improve the performance of data retrieval from tables. Indexes are created on one or more columns of a table, and are automatically maintained in the database. For more information, see ["Managing Indexes"](#) on page 6-14.

- **Views**

You can create a view that combines information from several different tables into a single presentation. A view can rely on information from both tables and other views. For more information, see ["Creating and Managing Views"](#) on page 6-17.

- **Sequences**

When all records of a table must be distinct, you can use a sequence to generate a serial list of unique integers for numeric columns, each of which represents the ID of one record. For more information, see ["Creating and Managing Sequences"](#) on page 6-20.

- **Synonyms**

Synonyms are aliases for schema objects. You can use synonyms for security and convenience; for example, to hide the ownership of an object or to simplify SQL statements. For more information, see ["Creating and Managing Synonyms"](#) on page 6-22.

- **Stored subprograms**

Stored subprograms (also called **schema-level subprograms**) are procedures and functions that are stored in the database. They can be invoked from client applications that access the database. For more information, see ["Developing Stored Subprograms and Packages"](#) on page 7-1.

Triggers are stored subprograms that are automatically run by the database when specified events occur in a particular table or view. Triggers can restrict access to specific data and perform logging. For more information, see ["Using Triggers"](#) on page 8-1.

- **Packages**

A package is a group of related subprograms, along with the explicit cursors and variables they use, stored in the database as a unit, for continued use. Like stored subprograms, package subprograms can be invoked from client applications that access the database. For more information, see ["Developing Stored Subprograms and Packages"](#) on page 7-1.

Typically, the objects that an application uses belong to the same schema.

See Also: *Oracle Database Concepts* for a comprehensive introduction to schema objects

About Oracle Database Access

You can access Oracle Database only through a client program, such as SQL*Plus or SQL Developer. The client program's interface to Oracle Database is Structured Query Language (SQL). Oracle provides an extension to SQL called Procedural Language/SQL (PL/SQL).

Topics:

- [About SQL*Plus](#)
- [About SQL Developer](#)
- [About Structured Query Language \(SQL\)](#)
- [About Procedural Language/SQL \(PL/SQL\)](#)
- [About Other Client Programs, Languages, and Development Tools](#)

About SQL*Plus

SQL*Plus (pronounced *sequel plus*) is an interactive and batch query tool that is installed with every Oracle Database installation. It has a command-line user interface that acts as the client when connecting to the database.

SQL*Plus has its own commands and environment. In the SQL*Plus environment, you can enter and run SQL*Plus commands, SQL statements, PL/SQL statements, and operating system commands to perform tasks such as:

- Formatting, performing calculations on, storing, and printing query results
- Examining tables and object definitions
- Developing and running batch scripts
- Performing database administration

You can use SQL*Plus to generate reports interactively, to generate reports as batch processes, and to output the results to text file, to screen, or to HTML file for browsing on the Internet. You can generate reports dynamically using the HTML output facility.

You can use SQL*Plus in SQL Developer. For details, see *Oracle Database SQL Developer User's Guide*.

See Also:

- ["Connecting to Oracle Database from SQL*Plus"](#) on page 2-1
- *SQL*Plus User's Guide and Reference* for complete information about SQL*Plus

About SQL Developer

SQL Developer (pronounced *sequel developer*) is a graphic version of SQL*Plus, written in Java, that is available in the default installation of Oracle Database and by free download.

The SQL Developer user interface includes a navigation frame, tools (with menus), and a SQL Worksheet. From the SQL Worksheet, you can enter and run SQL statements, PL/SQL statements, and SQL*Plus commands. You can do some tasks—for example, creating a table—either in the SQL Worksheet or with the navigation frame and tools.

To see the name and keyboard equivalent of any SQL Developer icon, position your cursor over the icon.

See Also:

- ["Connecting to Oracle Database from SQL Developer"](#) on page 2-2
- *Oracle Database SQL Developer User's Guide* for complete information about SQL Developer

About Structured Query Language (SQL)

Structured Query Language (SQL) (pronounced *sequel*) is the set-based, high-level computer language with which all programs and users access data in Oracle Database.

SQL is a declarative, or nonprocedural, language; that is, it describes what to do, but not how. You specify the desired result set (for example, the names of current employees), but not how to get it.

See Also:

- *Oracle Database Concepts* for a complete overview of SQL
- *Oracle Database SQL Language Reference* for complete information about SQL

About Procedural Language/SQL (PL/SQL)

Procedural Language/SQL (PL/SQL) (pronounced *P L sequel*) is a native Oracle Database extension to SQL. It bridges the gap between declarative and imperative program control by adding procedural elements, such as conditional control and loops.

In PL/SQL, you can declare constants and variables, procedures and functions, types and variables of those types, and triggers. You can handle exceptions (run-time errors). You can create PL/SQL units—procedures, functions, packages, types, and triggers—that are stored in the database for reuse by applications that use any of the Oracle Database programmatic interfaces.

The basic unit of a PL/SQL source program is the block, which groups related declarations and statements. A block has an optional declarative part, a required executable part, and an optional exception-handling part.

See Also:

- *Oracle Database Concepts* for a complete overview of PL/SQL
- *Oracle Database PL/SQL Language Reference* for complete information about PL/SQL

About Other Client Programs, Languages, and Development Tools

Some other database access clients, languages, and tools that you can use to develop applications are:

Topics:

- [Oracle Application Express \(APEX\)](#)
- [Oracle Java Database Connectivity \(JDBC\)](#)
- [Hypertext Preprocessor \(PHP\)](#)
- [Oracle Call Interface \(OCI\)](#)
- [Oracle C++ Call Interface \(OCCI\)](#)
- [Open Database Connectivity \(ODBC\)](#)
- [Pro*C/C++ Precompiler](#)
- [Pro*COBOL Precompiler](#)

Oracle Application Express (APEX) Oracle Application Express (APEX) is an application development and deployment tool that enables you to quickly create secure and scalable Web applications even if you have limited previous programming experience. The embedded Application Builder tool assembles an HTML interface or a complete application that uses schema objects, such as tables or stored procedures, into a collection of pages that are linked through tabs, buttons, or hypertext links.

See Also: *Oracle Database 2 Day + Application Express Developer's Guide* for more information about APEX

Oracle Java Database Connectivity (JDBC) Oracle Java Database Connectivity (JDBC) is an API that enables Java to send SQL statements to an object-relational database, such as Oracle Database. Oracle Database JDBC provides complete support for the JDBC 3.0 and JDBC RowSet (JSR-114) standards, advanced connection caching for both XA and non-XA connections, exposure of SQL and PL/SQL data types to Java, and fast SQL data access.

See Also: For more information about JDBC:

- *Oracle Database Concepts*
- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database 2 Day + Java Developer's Guide*

Hypertext Preprocessor (PHP) The Hypertext Preprocessor (PHP) is a powerful interpreted server-side scripting language for quick Web application development. PHP is an open source language that is distributed under a BSD-style license. PHP is designed for embedding database access requests directly into HTML pages.

See Also: *Oracle Database 2 Day + PHP Developer's Guide* for more information about PHP

Oracle Call Interface (OCI) Oracle Call Interface (OCI) is the native C language API for accessing Oracle Database directly from C applications.

The OCI Software Development Kit is also installed as part of the Oracle Instant Client, which enables you to run applications without installing the standard Oracle client or having an ORACLE_HOME. Your applications work without change, using significantly less disk space.

See Also:

- *Oracle Database Advanced Application Developer's Guide* for more information about OCI
- *Oracle Call Interface Programmer's Guide* for complete information about OCI

Oracle C++ Call Interface (OCCI) Oracle C++ Call Interface (OCCI) is the native C++ language API for accessing Oracle Database directly from C++ applications. Very

similar to the OCI, OCCI supports both relational and object-oriented programming paradigms.

The OCCI Software Development Kit is also installed as part of the Oracle Instant Client, which enables you to run applications without installing the standard Oracle client or having an ORACLE_HOME. Your applications work without change, using significantly less disk space.

See Also:

- *Oracle Database Advanced Application Developer's Guide* for more information about OCCI
- *Oracle C++ Call Interface Programmer's Guide* for complete information about OCCI

Open Database Connectivity (ODBC) Open Database Connectivity (ODBC) is a set of database access APIs that connect to the database, prepare, and then run SQL statements on the database. An application that uses an ODBC driver can access non-uniform data sources, such as spreadsheets and comma-delimited files.

The Oracle ODBC driver conforms to ODBC 3.51 specifications. It supports all core APIs and a subset of Level 1 and Level 2 functions. Microsoft supplies the Driver manager component for the Windows platform.

Like OCI, OCCI, and JDBC, ODBC is part of the Oracle Instant Client installation.

See Also:

- *Oracle Database Concepts*
- *Oracle Services for Microsoft Transaction Server Developer's Guide* for information about using the Oracle ODBC driver with Windows
- *Oracle Database Administrator's Reference for Linux and UNIX-Based Operating Systems* for information about using Oracle ODBC driver on Linux

Pro*C/C++ Precompiler The Pro*C/C++ precompiler enables you to embed SQL statements in a C or C++ source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle run-time library calls, and generates a modified source program that you can compile, link, and run.

See Also:

- *Oracle Database Concepts* for more information about Oracle precompilers
- *Oracle Database Advanced Application Developer's Guide* for more information about the Pro*C/C++ precompiler
- *Pro*C/C++ Programmer's Guide* for complete information about the Pro*C/C++ precompiler

Pro*COBOL Precompiler The Pro*COBOL precompiler enables you to embed SQL statements in a COBOL source file. The precompiler accepts the source program as input, translates the embedded SQL statements into standard Oracle run-time library calls, and generates a modified source program that you can compile, link, and run.

See Also:

- *Oracle Database Concepts* for more information about Oracle precompilers
- *Oracle Database Advanced Application Developer's Guide* for more information about the Pro*COBOL precompiler
- *Pro*COBOL Programmer's Guide* for complete information about the Pro*COBOL precompiler

Microsoft .NET Framework

The Microsoft .NET Framework is a multilanguage environment for building, deploying, and running applications and XML Web services. Its main components are:

- **Common Language Runtime (CLR)**
The Common Language Runtime (CLR) is a language-neutral development and run-time environment that provides services that help manage running applications.
- **Framework Class Libraries (FCL)**
The Framework Class Libraries (FCL) provide a consistent, object-oriented library of prepackaged functionality.

Oracle Data Provider for .NET (ODP.NET)

Oracle Data Provider for .NET (ODP.NET) provides fast and efficient ADO.NET data access from .NET client applications to Oracle Database and access to other Oracle Database features.

ODP.NET allows developers to take advantage of advanced Oracle Database functionality, including Real Application Clusters, XML DB, and advanced security.

Oracle Developer Tools for Visual Studio (ODT)

Oracle Developer Tools for Visual Studio (ODT) is a set of application tools that integrate with the Visual Studio environment. These tools provide graphic user interface access to Oracle functionality, enable the user to perform a wide range of application development tasks, and improve development productivity and ease of use. Oracle Developer Tools supports the programming and implementation of .NET stored procedures using Visual Basic, C#, and other .NET languages.

.NET Stored Procedures

Oracle Database Extensions for .NET is a database option for Oracle Database on Windows. It makes it possible to build and run .NET stored procedures or functions with Oracle Database for Microsoft Windows using Visual Basic .NET or Visual C#.

After building .NET procedures and functions into a .NET assembly, you can deploy them in Oracle Database using the Oracle Deployment Wizard for .NET, a component of the Oracle Developer Tools for Visual Studio.

Oracle Providers for ASP.NET

Oracle Providers for ASP.NET offer ASP.NET developers an easy way to store state common to Web applications within Oracle Database. These providers are modeled on existing Microsoft ASP.NET providers, sharing similar schema and programming interfaces to provide .NET developers a familiar interface. Oracle supports the Membership, Profile, Role, and other providers.

- *Oracle Data Provider for .NET Developer's Guide for Microsoft Windows*
- *Oracle Database Extensions for .NET Developer's Guide for Microsoft Windows*
- *Oracle Database Advanced Application Developer's Guide*

Oracle Provider for OLE DB (OraOLEDB) Oracle Provider for OLE DB (OraOLEDB) is an open standard data access methodology that uses a set of Component Object Model (COM) interfaces for accessing and manipulating different types of data. These interfaces are available from various database providers.

See Also: *Oracle Provider for OLE DB Developer's Guide* for more information about OraOLEDB

Oracle Objects for OLE (OO4O) Oracle Objects for OLE (OO4O) provides easy access to data stored in Oracle Database with any programming or scripting language that supports the Microsoft COM Automation and ActiveX technology, including Visual Basic, Visual C++, Visual Basic For Applications (VBA), IIS Active Server Pages (VBScript and JavaScript).

See Also:

- *Oracle Database Advanced Application Developer's Guide* for more information about OO4O

- *Oracle Streams Advanced Queuing User's Guide* for examples of how to use Oracle Objects for OLE

About Sample Schema HR

The HR schema is a sample schema that can be installed as part of Oracle Database. This schema contains information about employees—their departments, locations, work histories, and related information. Like all schemas, the HR schema has tables, views, indexes, procedures, functions, and other attributes of a database schema.

The examples and tutorials in this document use the HR schema.

See Also:

- *Oracle Database Sample Schemas* for a complete description of the HR schema
- ["Connecting to Oracle Database as User HR"](#) on page 2-4 for instructions for connecting to Oracle Database as the user HR

Connecting to Oracle Database

You can connect to Oracle Database only through a client program, such as SQL*Plus or SQL Developer.

Note: After connecting to Oracle Database through a client program, you enter and run commands in that client program. For details, see the documentation for your client program.

This chapter contains the following sections:

- [Connecting to Oracle Database from SQL*Plus](#)
- [Connecting to Oracle Database from SQL Developer](#)
- [Connecting to Oracle Database as User HR](#)

Connecting to Oracle Database from SQL*Plus

SQL*Plus is a client program with which you can access Oracle Database. This section shows how to start SQL*Plus and connect to Oracle Database.

Note: For steps 3 and 4 of the following procedure, you need a user name and password.

To connect to Oracle Database from SQL*Plus:

1. If you are on a Windows system, display a Windows command prompt.
2. At the command prompt, type `sqlplus` and press the key **Enter**.
SQL*Plus starts and prompts you for your user name.
3. Type your user name and press the key **Enter**.
SQL*Plus prompts you for your password.
4. Type your password and press the key **Enter**.

Note: For security, your password is not visible on your screen.

The system connects you to an Oracle Database instance.

You are in the SQL*Plus environment. At the `SQL>` prompt, you can enter and run SQL*Plus commands, SQL statements, PL/SQL statements, and operating system commands.

To exit SQL*Plus, type `exit` and press the key **Enter**.

Note: Exiting SQL*Plus ends the SQL*Plus session, but does not shut down the Oracle Database instance.

[Example 2-1](#) starts SQL*Plus, connects to Oracle Database, runs a SQL `SELECT` statement, and exits SQL*Plus. User input is **bold**.

Example 2-1 Connecting to Oracle Database from SQL*Plus

```
> sqlplus
SQL*Plus: Release 11.2.0.0.1 - Beta on Mon Jun 9 15:31:26 2008

Enter user-name: your_user_name
Enter password: your_password

Connected to:
Oracle Database 11g Enterprise Edition Release 11.2.0.0.0 - Development
With the Partitioning, Data Mining and Real Application Testing options

SQL> select count(*) from employees;

COUNT(*)
-----
        107

SQL> exit

Disconnected from Oracle Database 11g Enterprise Edition Release 11.2.0.0.0 - Development
With the Partitioning, Data Mining and Real Application Testing options
>
```

See Also:

- ["Connecting to Oracle Database as User HR from SQL*Plus"](#) on page 2-5
- ["About SQL*Plus"](#) on page 1-4 for a brief description of SQL*Plus
- *SQL*Plus User's Guide and Reference* for more information about starting SQL*Plus and connecting to Oracle Database

Connecting to Oracle Database from SQL Developer

SQL Developer is a client program with which you can access Oracle Database. This section assumes that SQL Developer is installed on your system, and shows how to start it and connect to Oracle Database. If SQL Developer is not installed on your system, see *Oracle Database SQL Developer User's Guide* for installation instructions.

Note: For the following procedure:

- The first time you start SQL Developer on your system, you must provide the full path to `java.exe` in step 4.
 - For step 7, you need a user name and password.
 - For step 9, you need a host name and port.
-
-

To connect to Oracle Database from SQL Developer:

1. Access the menu from which you can select SQL Developer:
 - On a Windows system: From the Start menu, select **All Programs**.
 - On a Linux system:
 - On Gnome: Click **Application**.
 - On KDE: Click **K**.
2. Select **Oracle - ORACLE_HOME**.
3. Select **Application Development**.
4. Select **SQL Developer**.

If this is the first time you have started SQL Developer on your system, you are prompted to enter the full path to `java.exe` (for example, `C:\jdk1.5.0\bin\java.exe`). Either type the full path after the prompt or browse to it, and then press the key **Enter**.

The Oracle SQL Developer window opens.
5. In the navigation frame of the window, click **Connections**.

The Connections pane appears.
6. In the Connections pane, click the icon **New Connection**.

The New/Select Database Connection window opens.
7. In the New/Select Database Connection window, type the appropriate values in the fields Connection Name, Username, and Password.

For security, the password characters that you type appear as asterisks.

Near the Password field is the check box Save Password. By default, it is deselected. Oracle recommends accepting the default.
8. In the New/Select Database Connection window, click the tab **Oracle**.

The Oracle pane appears.
9. In the Oracle pane:
 - For Role, accept the default.
 - For Connection Type, accept the default (Basic).
 - In the fields Hostname and Port, type the appropriate values.
 - Select the option **SID**.
 - In the SID field, type the appropriate value.
10. In the New/Select Database Connection window, click the button **Test**.

The connection is tested. If the connection succeeds, the Status indicator changes from blank to Success.

11. If the test succeeded, click the button **Connect**.

The New/Select Database Connection window closes. The Connections pane shows the connection whose name you entered in the Connection Name field in step 7.

You are in the SQL Developer environment.

To exit SQL Developer, select **Exit** from the File menu.

Note: Exiting SQL Developer ends the SQL Developer session, but does not shut down the Oracle Database instance. The next time you start SQL Developer, the connection you created using the preceding procedure still exists. SQL Developer prompts you for the password that you supplied in step 7 (unless you selected the check box Save Password).

See Also:

- ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6
- ["About SQL Developer"](#) on page 1-4 for a brief description of SQL Developer
- *Oracle Database SQL Developer User's Guide* for more information about using SQL Developer to create connections to Oracle Database

Connecting to Oracle Database as User HR

This section shows how to unlock the HR account and connect to Oracle Database as the user HR, who owns the HR sample schema that the examples and tutorials in this document use.

To do the tutorials and examples in this document, and create the sample application, you must connect to Oracle Database as the user HR from SQL Developer. The HR sample schema is the **development environment** for the sample application.

Topics:

- [Unlocking the HR Account](#)
- [Connecting to Oracle Database as User HR from SQL*Plus](#)
- [Connecting to Oracle Database as User HR from SQL Developer](#)

Unlocking the HR Account

By default, when the HR schema is installed, the HR account is locked and its password is expired. You can connect to Oracle Database as the user HR only if the HR account is unlocked.

Note: For the following procedure, you need the name and password of a user who has the ALTER USER system privilege (for example, SYSTEM).

To unlock the HR account and reset its password:

1. Using SQL*Plus, connect to Oracle Database as a user with the ALTER USER system privilege.

For instructions, see ["Connecting to Oracle Database from SQL*Plus"](#) on page 2-1.

2. At the SQL> prompt, unlock the HR account and reset its password:

Caution: Choose a secure password. For guidelines for securing passwords, see *Oracle Database Security Guide*.

```
ALTER USER HR ACCOUNT UNLOCK IDENTIFIED BY password;
```

The system responds:

```
User altered
```

The HR account is unlocked and its password is *password*.

Now you can connect to Oracle Database as user HR with the password *password*. For instructions, see either ["Connecting to Oracle Database from SQL*Plus"](#) on page 2-1 or ["Connecting to Oracle Database from SQL Developer"](#) on page 2-2.

See Also:

- *Oracle Database 2 Day + Security Guide* for information about predefined user accounts provided by Oracle Database, including HR
- *Oracle Database SQL Developer User's Guide* for information about accessing SQL*Plus within SQL Developer
- *Oracle Database 2 Day DBA* for information about using Enterprise Manager to unlock user accounts

Connecting to Oracle Database as User HR from SQL*Plus

This section shows how to connect to Oracle Database as the user HR from SQL*Plus, if the HR account is unlocked.

To connect to Oracle Database as user HR from SQL*Plus:

Note: For this task, you need the password for the HR account.

1. If you are connected to Oracle Database, close your current connection.
2. Follow the directions in ["Connecting to Oracle Database from SQL*Plus"](#) on page 2-1, entering the user name HR at step 3 and the password for the HR account at step 4.

You are now connected to Oracle Database as the user HR.

See Also: *SQL*Plus User's Guide and Reference* for an example of using SQL*Plus to create an HR connection

Connecting to Oracle Database as User HR from SQL Developer

This section shows how to connect to Oracle Database as the user HR from SQL Developer, if the HR account is unlocked.

Note: For the following procedure, you need the password for the HR account.

To connect to Oracle Database as user HR from SQL Developer:

- Follow the directions in "[Connecting to Oracle Database from SQL Developer](#)" on page 2-2, entering the following values at steps 7 and 9.

At step 7:

- For Connection Name, enter `hr_conn`.
(You can enter a different name, but the tutorials in this document assume that you named the connection `hr_conn`.)
- For Username, enter `HR`.
- For Password, enter the password for the HR account.

At step 9:

- For Role, accept the default.
- For Connection Type, accept the default (Basic).
- For Hostname, enter `localhost`.
- For Port, enter `1521`.
- For SID, enter `orcl`.

At step 11, the name of the connection, `hr_conn`, appears in the Connections pane of the Oracle SQL Developer window.

You are now connected to Oracle Database as the user HR.

Exploring Oracle Database with SQL Developer

This chapter contains the following topics:

- [Tutorial: Viewing HR Schema Objects](#)
- [Tutorial: Viewing EMPLOYEES Table Properties and Data](#)

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user `HR` from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6.

Tutorial: Viewing HR Schema Objects

This tutorial shows how to use SQL Developer to view the objects that belong to the `HR` schema. This is called **browsing** the `HR` schema.

To browse the HR schema:

1. In the navigation frame, click the tab **Connections**.

The Connections pane shows the `hr_conn` icon. To the left of the icon is a plus sign (+).

2. Click the **plus sign**.

If you are not connected to the database, the Connection Information window opens. If you are connected to the database, the `hr_conn` information expands (see the information that follows "Click OK" in step 3).

3. If the Connection Information window opens:

1. In the User Name field, enter `hr`.
2. In the Password field, enter the password for the user `hr`.
3. Click **OK**.

The `hr_conn` information expands: The plus sign becomes a minus sign, and under the `hr_conn` icon, a list of schema object types appears—Tables, Views, Indexes,

and so on. (If you click the minus sign, the hr_conn information collapses: The minus sign becomes a plus sign, and the list disappears.)

See Also:

- ["About Schema Objects"](#) on page 1-2 for brief descriptions of the schema object types
- *Oracle Database SQL Developer User's Guide* for more information about the SQL Developer user interface

Tutorial: Viewing EMPLOYEES Table Properties and Data

This tutorial shows how to use SQL Developer to view the properties and data of the EMPLOYEES table in the HR schema, if you are browsing the HR schema.

If you are not browsing the HR schema, follow the instructions in ["Tutorial: Viewing HR Schema Objects"](#) on page 3-1 and then return to this topic.

To view the properties and data of the EMPLOYEES table:

1. In the Connections pane, expand **Tables**.

Under Tables, a list of the tables in the HR schema appears.

2. Select the table **EMPLOYEES**.

In the right frame of the Oracle SQL Developer window, in the Columns pane, a list of all columns of this table appears. To the right of each column are its properties—name, data type, and so on. (To see all column properties, move the horizontal scroll bar to the right.)

3. In the right frame, click the tab **Data**.

The Data pane appears, showing a numbered list of all records in this table. (To see more records, move the vertical scroll bar down. To see more columns of the records, move the horizontal scroll bar to the right.)

4. In the right frame, click the tab **Constraints**.

The Constraints pane appears, showing a list of all constraints on this table. To the right of each constraint are its properties—name, type, search condition, and so on. (To see all constraint properties, move the horizontal scroll bar to the right.)

5. Explore the other properties by clicking on the appropriate tabs.

See Also:

- *Oracle Database SQL Developer User's Guide* for more information about the SQL Developer user interface
- [Chapter 4, "Selecting Table Data,"](#) for information about using queries to see table data

Selecting Table Data

This chapter contains the following topics:

- [About Queries](#)
- [Running Queries in SQL Developer](#)
- [Tutorial: Selecting All Columns of a Table](#)
- [Tutorial: Selecting Specific Columns of a Table](#)
- [Displaying Selected Columns Under New Headings](#)
- [Selecting Data that Satisfies Specified Conditions](#)
- [Specifying Conditions with Regular Expressions](#)
- [Sorting Selected Data](#)
- [Selecting Data from Multiple Tables](#)
- [Using Operators and Functions in Queries](#)

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user `HR` from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6.

About Queries

A **query**, or SQL `SELECT` statement, selects data from one or more tables or views.

The simplest form of query has this syntax:

```
SELECT select_list FROM source_list
```

The *select_list* specifies the columns from which the data is to be selected, and the *source_list* specifies the tables or views that have these columns.

A query nested within another SQL statement is called a **subquery**.

In the SQL*Plus environment, you can enter a query after the `SQL>` prompt.

In the SQL Developer environment, you can enter a query in the SQL Worksheet. For instructions, see ["Running Queries in SQL Developer"](#) on page 4-2.

Note: When the result of a query is displayed, records can be in any order, unless you specify their order with the `ORDER BY` clause. For more information, see ["Sorting Selected Data"](#) on page 4-11.

See Also:

- *Oracle Database SQL Language Reference* for more information about queries and subqueries
- *Oracle Database SQL Language Reference* for more information about the `SELECT` statement
- *SQL*Plus User's Guide and Reference* for more information about the SQL*Plus command line interface
- *Oracle Database SQL Developer User's Guide* for information about using the SQL Worksheet in SQL Developer

Running Queries in SQL Developer

This topic explains how to run queries or other SQL statements in SQL Developer, if you are connected to Oracle Database as user HR from SQL Developer (for instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6).

To run queries in SQL Developer:

1. Click the icon **SQL Worksheet**.

Either the Connection Information window opens or the SQL Worksheet pane appears.

2. If the Select Connection window opens:

1. If the Connection field does not have the value `hr_conn`, select that value from the drop-down list.
2. Click **OK**.

The SQL Worksheet pane appears. Under "Enter SQL Statement:" is a field where you can enter a SQL statement.

3. In the SQL Worksheet pane, type a query (a `SELECT` statement).
4. Click the icon **Execute Statement**.

The query runs.

5. Click the tab **Results**.

The Results pane appears, showing the result of the query.

6. Click the icon **Clear**.

The query and its results disappear, and you can enter another SQL statement in the SQL Worksheet.

See Also: *Oracle Database SQL Developer User's Guide* for information about using the SQL Worksheet in SQL Developer

Tutorial: Selecting All Columns of a Table

This tutorial shows how to select all columns of the `EMPLOYEES` table.

To select all columns of the `EMPLOYEES` Table:

1. Click the icon **SQL Worksheet**.

The SQL Worksheet pane appears.

2. In the field under "Enter SQL Statement:", enter this query:

```
SELECT * FROM EMPLOYEES;
```

3. Click the **Execute Statement**.

The query runs.

4. Click the tab **Results**.

The Results pane appears, showing the result of the query.

See Also: ["Tutorial: Viewing `EMPLOYEES` Table Properties and Data"](#) on page 3-2 for information about another way to view table data with SQL Developer

Tutorial: Selecting Specific Columns of a Table

This tutorial shows how to select only the columns `FIRST_NAME`, `LAST_NAME`, and `DEPARTMENT_ID` of the `EMPLOYEES` table.

To select only `FIRST_NAME`, `LAST_NAME`, and `DEPARTMENT_ID`:

1. Click the icon **SQL Worksheet**.

The SQL Worksheet pane appears.

2. In the field under "Enter SQL Statement:", enter this query:

```
SELECT FIRST_NAME, LAST_NAME, DEPARTMENT_ID
FROM EMPLOYEES;
```

3. Click the icon **Execute Statement**.

The query runs.

4. Click the tab **Results**.

The Results pane appears, showing the results of the query, which are similar to:

FIRST_NAME	LAST_NAME	DEPARTMENT_ID
Donald	OConnell	50
Douglas	Grant	50
Jennifer	Whalen	10
Michael	Hartstein	20
Pat	Fay	20
Susan	Mavris	40
Hermann	Baer	70
Shelley	Higgins	110
William	Gietz	110
Steven	King	90
Neena	Kochhar	90
FIRST_NAME	LAST_NAME	DEPARTMENT_ID

```

-----
Lex                De Haan                90
...
Kevin              Feeney                50

107 rows selected.

```

Displaying Selected Columns Under New Headings

When query results are displayed, the default column heading is the column name. To display a column under a new heading, specify the new heading (**alias**) immediately after the name of the column. The alias renames the column for the duration of the query, but does not change its name in the database.

The query in [Example 4-1](#) selects the same columns as the query in [Tutorial: Selecting Specific Columns of a Table](#), but it also specifies aliases for them. Because the aliases are not enclosed in double quotation marks, they are displayed in uppercase letters.

Example 4-1 Displaying Selected Columns Under New Headings

```

SELECT FIRST_NAME First, LAST_NAME last, DEPARTMENT_ID Dept
FROM EMPLOYEES;

```

Result is similar to:

```

FIRST                LAST                DEPT
-----
Donald              OConnell                50
Douglas              Grant                   50
Jennifer             Whalen                  10
Michael              Hartstein               20
Pat                  Fay                     20
Susan                Mavris                  40
Hermann              Baer                    70
Shelley              Higgins                 110
William              Gietz                  110
Steven               King                    90
Neena                Kochhar                 90

FIRST                LAST                DEPT
-----
Lex                  De Haan                90
...
Kevin                Feeney                 50

```

107 rows selected.

If you enclose column aliases in double quotation marks, case is preserved, and the aliases can include spaces, as in [Example 4-2](#).

Example 4-2 Preserving Case and Including Spaces in Column Aliases

```

SELECT FIRST_NAME "Given Name", LAST_NAME "Family Name"
FROM EMPLOYEES;

```

Result is similar to:

```

Given Name          Family Name
-----
Donald              OConnell

```

Douglas	Grant
Jennifer	Whalen
Michael	Hartstein
Pat	Fay
Susan	Mavris
Hermann	Baer
Shelley	Higgins
William	Gietz
Steven	King
Neena	Kochhar

Given Name	Family Name
-----	-----
Lex	De Haan
...	
Kevin	Feeney

107 rows selected.

See Also: *Oracle Database SQL Language Reference* for more information about the `SELECT` statement, including the column alias (`c_alias`)

Selecting Data that Satisfies Specified Conditions

To select only data that matches a specified condition, include the `WHERE` clause in the `SELECT` statement. The condition in the `WHERE` clause can be any SQL condition (for information about SQL conditions, see *Oracle Database SQL Language Reference*).

The query in [Example 4-3](#) selects data only for employees in department 90.

Example 4-3 Selecting Data from One Department

```
SELECT FIRST_NAME, LAST_NAME, DEPARTMENT_ID
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 90;
```

Result is similar to:

FIRST_NAME	LAST_NAME	DEPARTMENT_ID
-----	-----	-----
Steven	King	90
Neena	Kochhar	90
Lex	De Haan	90

The query in [Example 4-4](#) selects data only for employees in departments 100, 110, and 120.

Example 4-4 Selecting Data from Specified Departments

```
SELECT FIRST_NAME, LAST_NAME, DEPARTMENT_ID
FROM EMPLOYEES
WHERE DEPARTMENT_ID IN (100, 110, 120);
```

Result is similar to:

FIRST_NAME	LAST_NAME	DEPARTMENT_ID
-----	-----	-----
John	Chen	100
Daniel	Faviet	100

William	Gietz	110
Nancy	Greenberg	100
Shelley	Higgins	110
Luis	Popp	100
Ismael	Sciarra	100
Jose Manuel	Urman	100

8 rows selected.

There are no employees in department 120.

The query in [Example 4-5](#) selects data only for employees whose last names start with "Ma".

Example 4-5 Selecting Data for Last Names that Start with the Same Substring

```
SELECT FIRST_NAME, LAST_NAME
FROM EMPLOYEES
WHERE LAST_NAME LIKE 'Ma%';
```

Result is similar to:

FIRST_NAME	LAST_NAME
Jason	Mallin
Steven	Markle
James	Marlow
Mattea	Marvins
Randall	Matos
Susan	Mavris

6 rows selected.

The query in [Example 4-6](#) selects data only for employees whose last names include "ma".

Example 4-6 Selecting Data for Last Names that Include the Same Substring

```
SELECT FIRST_NAME, LAST_NAME
FROM EMPLOYEES
WHERE LAST_NAME LIKE '%ma%';
```

Result is similar to:

FIRST_NAME	LAST_NAME
Sundita	Kumar
Jose Manuel	Urman
Shanta	Vollman

The query in [Example 4-7](#) tests for two conditions—whether the salary is at least 11000, and whether the commission percentage is not null.

Example 4-7 Selecting Data that Satisfies Two Conditions

```
SELECT FIRST_NAME, LAST_NAME, SALARY, COMMISSION_PCT "%"
FROM EMPLOYEES
WHERE (SALARY >= 11000) AND (COMMISSION_PCT IS NOT NULL);
```

Result is similar to:

FIRST_NAME	LAST_NAME	SALARY	%
------------	-----------	--------	---

John	Russell	14000	.4
Karen	Partners	13500	.3
Alberto	Errazuriz	12000	.3
Gerald	Cambrault	11000	.3
Lisa	Ozer	11500	.25
Ellen	Abel	11000	.3

6 rows selected.

Specifying Conditions with Regular Expressions

As stated in "Selecting Data that Satisfies Specified Conditions" on page 4-5, the condition in the `WHERE` clause can be any SQL condition. This topic shows how to specify conditions with SQL functions that accept regular expressions. A regular expression defines a search pattern, using metacharacters to specify search algorithms and literals to specify characters.

Suppose that you want to select all managers in the `EMPLOYEES` table. The `JOB_ID` of a manager ends with either `'_MGR'` or `'_MAN'`, depending on the department. Therefore, the search pattern must be a regular expression, and you must use the `REGEXP_LIKE` function, as in [Example 4-8](#).

In the regular expression `(_m[an|gr])`, the metacharacter `|` indicates the `OR` condition. The third function parameter, `'i'`, specifies that the match is case-insensitive.

Example 4-8 Selecting All Managers in the EMPLOYEES Table

```
SELECT FIRST_NAME, LAST_NAME, JOB_ID
FROM EMPLOYEES
WHERE REGEXP_LIKE(JOB_ID, '(_m[an|gr])', 'i');
```

Result is similar to:

FIRST_NAME	LAST_NAME	JOB_ID
Michael	Hartstein	MK_MAN
Shelley	Higgins	AC_MGR
Nancy	Greenberg	FI_MGR
Den	Raphaely	PU_MAN
Matthew	Weiss	ST_MAN
Adam	Fripp	ST_MAN
Payam	Kaufling	ST_MAN
Shanta	Vollman	ST_MAN
Kevin	Mourgos	ST_MAN
John	Russell	SA_MAN
Karen	Partners	SA_MAN

FIRST_NAME	LAST_NAME	JOB_ID
Alberto	Errazuriz	SA_MAN
Gerald	Cambrault	SA_MAN
Eleni	Zlotkey	SA_MAN

14 rows selected.

Suppose that you want to select every employee whose last name has a double vowel (two adjacent occurrences of the same vowel). [Example 4–9](#) shows how you can do this.

The regular expression `([AEIOU])` represents any vowel. The metacharacter `\1` represents the first (and in this case, only) regular expression. The third function parameter, `'i'`, specifies that the match is case-insensitive.

Example 4–9 Selecting All Employees Whose Last Names Have Double Vowels

```
SELECT FIRST_NAME, LAST_NAME
FROM EMPLOYEES
WHERE REGEXP_LIKE(LAST_NAME, '([AEIOU])\1', 'i');
```

Result is similar to:

FIRST_NAME	LAST_NAME
Harrison	Bloom
Lex	De Haan
Kevin	Feeney
Ki	Gee
Nancy	Greenberg
Danielle	Greene
Alexander	Khoo
David	Lee

8 rows selected.

Suppose that, in the displayed query results, you want to replace phone numbers that are stored in the format `nnn.nnn.nnnn` with their equivalents in the format `(nnn) nnn-xxxx`. You can use the `REGEXP_REPLACE` function, with regular expressions in the search pattern (the stored format) and references to those regular expressions in the replace string (the display format), as in [Example 4–10](#).

The search pattern has three regular expressions, each of which is enclosed in parentheses. The metacharacter `[[:digit:]]` represents a digit, the metacharacter `{n}` specifies *n* occurrences, and the metacharacter `\` is an escape character. The character immediately after an escape character is interpreted as a literal. Without the escape character, the metacharacter `.` represents any character.

The replace string uses `\1`, `\2`, and `\3` to represent the first, second, and third regular expressions in the search pattern, respectively. (In the replace string, `\` is not an escape character.)

Example 4–10 Displaying Phone Numbers in a Different Format

```
SELECT PHONE_NUMBER "Old Format",
REGEXP_REPLACE(PHONE_NUMBER,
'([[:digit:]]{3})\.([[:digit:]]{3})\.([[:digit:]]{4})',
'(\1) \2-\3') "New Format"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 90;
```

Result is similar to:

Old Format	New Format
------------	------------

```

515.123.4567      (515) 123-4567
515.123.4568      (515) 123-4568
515.123.4569      (515) 123-4569

```

Suppose that you want to extract the street number from each `STREET_ADDRESS` in the `LOCATIONS` table. Some street numbers include hyphens, so the search pattern must use a regular expression, and you must use the `REGEXP_SUBSTR` function, as in [Example 4-11](#).

Example 4-11 Extracting the Street Number from Each `STREET_ADDRESS`

```

COLUMN Number FORMAT A8
SELECT STREET_ADDRESS "Address",
       REGEXP_SUBSTR(STREET_ADDRESS, '[:digit:]-]+') "Number"
FROM LOCATIONS;
COLUMN Number CLEAR

```

Result is similar to:

Address	Number
-----	-----
1297 Via Cola di Rie	1297
93091 Calle della Testa	93091
2017 Shinjuku-ku	2017
9450 Kamiya-cho	9450

Sorting Selected Data

When the results of a query are displayed, records can be in any order, unless you specify their order with the ORDER BY clause.

The results of the query in [Example 4-14](#) are sorted by LAST_NAME, in ascending order (the default).

Alternatively, in SQL Developer, you can omit the ORDER BY clause and double-click the name of the column to sort.

Example 4-14 *Sorting Selected Data by LAST_NAME*

```

SELECT FIRST_NAME, LAST_NAME, HIRE_DATE
FROM EMPLOYEES
ORDER BY LAST_NAME;

```

Result:

FIRST_NAME	LAST_NAME	HIRE_DATE
Ellen	Abel	11-MAY-96
Sundar	Ande	24-MAR-00
Mozhe	Atkinson	30-OCT-97
David	Austin	25-JUN-97
Hermann	Baer	07-JUN-94
Shelli	Baida	24-DEC-97
Amit	Banda	21-APR-00
Elizabeth	Bates	24-MAR-99
...		
FIRST_NAME	LAST_NAME	HIRE_DATE
Jose Manuel	Urman	07-MAR-98
Peter	Vargas	09-JUL-98
Clara	Vishney	11-NOV-97
Shanta	Vollman	10-OCT-97
Alana	Walsh	24-APR-98
Matthew	Weiss	18-JUL-96
Jennifer	Whalen	17-SEP-87
Eleni	Zlotkey	29-JAN-00

107 rows selected

The sort criterion need not be included in the select list, as [Example 4-15](#) shows.

Example 4-15 Sorting Selected Data by an Unselected Column

```
SELECT FIRST_NAME, HIRE_DATE
FROM EMPLOYEES
ORDER BY LAST_NAME;
```

Result:

FIRST_NAME	HIRE_DATE
Ellen	11-MAY-96
Sundar	24-MAR-00
Mozhe	30-OCT-97
David	25-JUN-97
Hermann	07-JUN-94
Shelli	24-DEC-97
Amit	21-APR-00
Elizabeth	24-MAR-99
...	
FIRST_NAME	HIRE_DATE
Jose Manuel	07-MAR-98
Peter	09-JUL-98
Clara	11-NOV-97
Shanta	10-OCT-97
Alana	24-APR-98
Matthew	18-JUL-96
Jennifer	17-SEP-87
Eleni	29-JAN-00

107 rows selected.

See Also: *Oracle Database SQL Language Reference* for more information about the SELECT statement, including the ORDER BY clause

Selecting Data from Multiple Tables

Suppose that you want to select the FIRST_NAME, LAST_NAME, and DEPARTMENT_NAME of every employee. FIRST_NAME and LAST_NAME are in the EMPLOYEES table, and DEPARTMENT_NAME is in the DEPARTMENTS table. Both tables have DEPARTMENT_ID. You can use the query in [Example 4–16](#). Such a query is called a **join**.

Example 4–16 Selecting Data from Two Tables (Joining Two Tables)

```
SELECT EMPLOYEES.FIRST_NAME "First",
EMPLOYEES.LAST_NAME "Last",
DEPARTMENTS.DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES, DEPARTMENTS
WHERE EMPLOYEES.DEPARTMENT_ID = DEPARTMENTS.DEPARTMENT_ID;
```

Result:

First	Last	Dept. Name
-----	-----	-----
Jennifer	Whalen	Administration
Michael	Hartstein	Marketing
Pat	Fay	Marketing
Den	Raphaely	Purchasing
Karen	Colmenares	Purchasing
Alexander	Khoo	Purchasing
Shelli	Baida	Purchasing
Sigal	Tobias	Purchasing
Guy	Himuro	Purchasing
Susan	Mavris	Human Resources
Donald	OConnell	Shipping
First	Last	Dept. Name
-----	-----	-----
Douglas	Grant	Shipping
...		
Shelley	Higgins	Accounting

106 rows selected.

Table-name qualifiers are optional for column names that appear in only one table of a join, but are required for column names that appear in both tables. The following query is equivalent to the query in [Example 4–16](#):

```
SELECT FIRST_NAME "First",
LAST_NAME "Last",
DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES, DEPARTMENTS
WHERE EMPLOYEES.DEPARTMENT_ID = DEPARTMENTS.DEPARTMENT_ID;
```

To make queries that use qualified column names more readable, use table aliases, as in the following example:

```
SELECT FIRST_NAME "First",
LAST_NAME "Last",
DEPARTMENT_NAME "Dept. Name"
FROM EMPLOYEES e, DEPARTMENTS d
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID;
```

Although you create the aliases in the `FROM` clause, you can use them earlier in the query, as in the following example:

```
SELECT e.FIRST_NAME "First",  
       e.LAST_NAME "Last",  
       d.DEPARTMENT_NAME "Dept. Name"  
FROM EMPLOYEES e, DEPARTMENTS d  
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID;
```

See Also: *Oracle Database SQL Language Reference* for more information about joins

Using Operators and Functions in Queries

The *select_list* of a query can include SQL expressions, which can include SQL operators and SQL functions. These operators and functions can have table data as operands and arguments. The SQL expressions are evaluated, and their values appear in the results of the query.

Topics:

- [Using Arithmetic Operators in Queries](#)
- [Using Numeric Functions in Queries](#)
- [Using the Concatenation Operator in Queries](#)
- [Using Character Functions in Queries](#)
- [Using Datetime Functions in Queries](#)
- [Using Conversion Functions in Queries](#)
- [Using Aggregate Functions in Queries](#)
- [Using NULL-Related Functions in Queries](#)
- [Using CASE Expressions in Queries](#)
- [Using the DECODE Function in Queries](#)

See Also:

- *Oracle Database SQL Language Reference* for more information about SQL operators
- *Oracle Database SQL Language Reference* for more information about SQL functions

Using Arithmetic Operators in Queries

SQL supports the basic arithmetic operators: + (addition), - (subtraction), * (multiplication), and / (division).

The query in [Example 4-17](#) displays `LAST_NAME`, `SALARY` (monthly pay), and annual pay for each employee in department 90, in descending order of `SALARY`.

Example 4-17 Using an Arithmetic Expression in a Query

```
SELECT LAST_NAME,  
       SALARY "Monthly Pay",  
       SALARY * 12 "Annual Pay"  
FROM EMPLOYEES
```

```
WHERE DEPARTMENT_ID = 90
ORDER BY SALARY DESC;
```

Result:

LAST_NAME	Monthly Pay	Annual Pay
King	24000	288000
De Haan	17000	204000
Kochhar	17000	204000

Using Numeric Functions in Queries

Numeric functions accept numeric input and return numeric values. Each numeric function returns a single value for each row that is evaluated. The numeric functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 4–18](#) uses the numeric function `ROUND` to display the daily pay of each employee in department 100, rounded to the nearest cent.

Example 4–18 Rounding Numeric Data

```
SELECT LAST_NAME,
ROUND (((SALARY * 12)/365), 2) "Daily Pay"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Daily Pay
Chen	269.59
Faviet	295.89
Greenberg	394.52
Popp	226.85
Sciarra	253.15
Urman	256.44

6 rows selected.

The query in [Example 4–19](#) uses the numeric function `TRUNC` to display the daily pay of each employee in department 100, truncated to the nearest dollar.

Example 4–19 Truncating Numeric Data

```
SELECT LAST_NAME,
TRUNC (((SALARY * 12)/365), 2) "Daily Pay"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Daily Pay
Chen	269
Faviet	295
Greenberg	394
Popp	226
Sciarra	253

Urman 256

6 rows selected.

See Also: *Oracle Database SQL Language Reference* for more information about SQL numeric functions

Using the Concatenation Operator in Queries

The concatenation operator (||) combines two strings into one string, by appending the second string to the first. For example, 'a' || 'b' = 'ab'. You can use this operator to combine information from two columns or expressions in the same column of the report, as in the query in [Example 4–20](#).

Example 4–20 Concatenating Character Data

```
SELECT FIRST_NAME || ' ' || LAST_NAME "Name"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

Name

John Chen
Daniel Faviet
Nancy Greenberg
Luis Popp
Ismael Sciarra
Jose Manuel Urman

6 rows selected.

Using Character Functions in Queries

Character functions accept character input. Most return character values, but some return numeric values. Each character function returns a single value for each row that is evaluated. The character functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The functions UPPER, INITCAP, and LOWER display their character arguments in uppercase, initial capital, and lowercase, respectively.

The query in [Example 4–21](#) displays LAST_NAME in uppercase, FIRST_NAME with the first character in uppercase and all others in lowercase, and EMAIL in lowercase.

Example 4–21 Changing the Case of Character Data

```
SELECT UPPER(LAST_NAME) "Last",
       INITCAP(FIRST_NAME) "First",
       LOWER(EMAIL) "E-Mail"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY EMAIL;
```

Result:

Last	First	E-Mail
FAVIET	Daniel	dfaviet

SCIARRA	Ismael	isciarra
CHEN	John	jchen
URMAN	Jose Manuel	jmurman
POPP	Luis	lpopp
GREENBERG	Nancy	ngreenbe

6 rows selected.

The functions `LTRIM` and `RTRIM` trim characters from the left and right ends of their character arguments, respectively. The function `TRIM` trims leading zeros, trailing zeros, or both.

The query in [Example 4-22](#) finds every clerk in the `EMPLOYEES` table and trims '`_CLERK`' from the `JOB_ID`, displaying only the characters that identify the type of clerk.

Example 4-22 Trimming Character Data

```
SELECT LAST_NAME,
       RTRIM(JOB_ID, '_CLERK') "Clerk Type"
FROM EMPLOYEES
WHERE JOB_ID LIKE '%_CLERK'
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Clerk Type
Atkinson	ST
Baida	PU
Bell	SH
Bissot	ST
Bull	SH
Cabrio	SH
Chung	SH
Colmenares	PU
Davies	ST
Dellinger	SH
Dilly	SH
...	
Everett	SH
Feeney	SH
...	
Walsh	SH

45 rows selected.

The functions `LPAD` and `RPAD` pad their character arguments on the left and right, respectively, with a specified character (the default character is a space).

The query in [Example 4-23](#) displays `FIRST_NAME` and `LAST_NAME` in 15-character columns, blank-padding `FIRST_NAME` on the left and `LAST_NAME` on the right.

Example 4-23 Padding Character Data

```
SELECT LPAD(FIRST_NAME,15) "First",
       RPAD(LAST_NAME,15) "Last"
FROM EMPLOYEES
```

```
WHERE DEPARTMENT_ID = 100
ORDER BY FIRST_NAME;
```

Result:

First	Last
Daniel	Faviet
Ismael	Sciarra
John	Chen
Jose Manuel	Urman
Luis	Popp
Nancy	Greenberg

6 rows selected.

The SUBSTR function accepts as arguments a string, a character position, and a length, and returns the substring that starts at the specified position in the string and has the specified length.

The query in [Example 4-24](#) uses SUBSTR to abbreviate FIRST_NAME to first initial and to strip the area code from PHONE_NUMBER.

Example 4-24 Extracting Substrings from Character Data

```
SELECT SUBSTR(FIRST_NAME, 1, 1) || '. ' || LAST_NAME "Name",
SUBSTR(PHONE_NUMBER, 5, 8) "Phone"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

Name	Phone
J. Chen	124.4269
D. Faviet	124.4169
N. Greenberg	124.4569
L. Popp	124.4567
I. Sciarra	124.4369
J. Urman	124.4469

6 rows selected.

The REPLACE function replaces one substring with another.

The query in [Example 4-25](#) uses the SUBSTR function in the WHERE clause to select the employees whose JOB_ID starts with 'SH', and uses the REPLACE function to replace 'SH' with 'SHIPPING' in each such JOB_ID.

Example 4-25 Replacing Substrings in Character Data

```
COLUMN "Job" FORMAT A15;
SELECT LAST_NAME,
REPLACE(JOB_ID, 'SH', 'SHIPPING') "Job"
FROM EMPLOYEES
WHERE SUBSTR(JOB_ID, 1, 2) = 'SH'
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	Job
-----------	-----

```

-----
Bell                SHIPPING_CLERK
Bull                SHIPPING_CLERK
Cabrio              SHIPPING_CLERK
Chung               SHIPPING_CLERK
Dellinger           SHIPPING_CLERK
Dilly               SHIPPING_CLERK
Everett             SHIPPING_CLERK
Feeney              SHIPPING_CLERK
Fleaur              SHIPPING_CLERK
Gates               SHIPPING_CLERK
Geoni               SHIPPING_CLERK

LAST_NAME           Job
-----
Grant                SHIPPING_CLERK
Jones                SHIPPING_CLERK
McCain               SHIPPING_CLERK
OConnell             SHIPPING_CLERK
Perkins              SHIPPING_CLERK

Sullivan             SHIPPING_CLERK
Taylor               SHIPPING_CLERK
Walsh                SHIPPING_CLERK

```

20 rows selected.

See Also: *Oracle Database SQL Language Reference* for more information about SQL character functions

Using Datetime Functions in Queries

Datetime functions operate on date, timestamp, and interval values. Each datetime function returns a single value for each row that is evaluated. The datetime functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

To understand [Example 4-26](#), you must understand the `JOB_HISTORY` table.

When an employee changes jobs, the `START_DATE` and `END_DATE` of his or her previous job are recorded in the `JOB_HISTORY` table. Employees who have changed jobs more than once have multiple rows in the `JOB_HISTORY` table, as the following query and its results show:

```

SELECT * FROM JOB_HISTORY
ORDER BY EMPLOYEE_ID;

```

Result:

```

EMPLOYEE_ID  START_DAT  END_DATE   JOB_ID      DEPARTMENT_ID
-----
101  21-SEP-89  27-OCT-93  AC_ACCOUNT      110
101  28-OCT-93  15-MAR-97  AC_MGR           110
102  13-JAN-93  24-JUL-98  IT_PROG          60
114  24-MAR-98  31-DEC-99  ST_CLERK         50
122  01-JAN-99  31-DEC-99  ST_CLERK         50
176  24-MAR-98  31-DEC-98  SA_REP           80
176  01-JAN-99  31-DEC-99  SA_MAN           80
200  17-SEP-87  17-JUN-93  AD_ASST          90
200  01-JUL-94  31-DEC-98  AC_ACCOUNT       90
201  17-FEB-96  19-DEC-99  MK_REP           20

```

10 rows selected.

The query in [Example 4-26](#) uses the MONTHS_BETWEEN function to show how many months each employee held each of his or her previous jobs. For information about the MONTHS_BETWEEN function, see *Oracle Database SQL Language Reference*.

Example 4-26 Displaying the Number of Months Between Dates

```
SELECT e.EMPLOYEE_ID,  
       e.LAST_NAME,  
       TRUNC(MONTHS_BETWEEN(j.END_DATE, j.START_DATE)) "Months Worked"  
FROM EMPLOYEES e, JOB_HISTORY j  
WHERE e.EMPLOYEE_ID = j.EMPLOYEE_ID  
ORDER BY "Months Worked";
```

Result:

EMPLOYEE_ID	LAST_NAME	Months Worked
176	Taylor	9
122	Kaufling	11
176	Taylor	11
114	Raphaely	21
101	Kochhar	40
201	Hartstein	46
101	Kochhar	49
200	Whalen	53
102	De Haan	66
200	Whalen	69

10 rows selected.

The query in [Example 4-27](#) uses the EXTRACT and SYSDATE functions to show how many years each employee in department 100 has been employed. The SYSDATE function returns the current date of the system clock. For more information about the SYSDATE function, see *Oracle Database SQL Language Reference*. For information about the EXTRACT function, see *Oracle Database SQL Language Reference*.

Example 4-27 Displaying the Number of Years Between Dates

```
SELECT LAST_NAME,  
       (EXTRACT(YEAR FROM SYSDATE) - EXTRACT(YEAR FROM HIRE_DATE)) "Years Employed"  
FROM EMPLOYEES  
WHERE DEPARTMENT_ID = 100  
ORDER BY "Years Employed";
```

Result:

LAST_NAME	Years Employed
Popp	9
Urman	10
Chen	11
Sciarra	11
Greenberg	14
Faviet	14

6 rows selected.

Suppose that an employee receives his or her first check on the last day of the month in which he or she was hired. The query in [Example 4-28](#) uses the `LAST_DAY` function to show the first pay day for each employee in department 100. For information about the `LAST_DAY` function, see *Oracle Database SQL Language Reference*.

Example 4-28 Displaying the Last Day of a Selected Month

```
SELECT LAST_NAME,
       HIRE_DATE "Hired",
       LAST_DAY(HIRE_DATE) "Paid"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY HIRE_DATE;
```

Result:

LAST_NAME	Hired	Paid
Faviet	16-AUG-94	31-AUG-94
Greenberg	17-AUG-94	31-AUG-94
Chen	28-SEP-97	30-SEP-97
Sciarra	30-SEP-97	30-SEP-97
Urman	07-MAR-98	31-MAR-98
Popp	07-DEC-99	31-DEC-99

6 rows selected.

Suppose that an employee receives his or her first evaluation six months after being hired. The query in [Example 4-29](#) uses the `ADD_MONTHS` function to show the first evaluation day for each employee in department 100. For information about the `ADD_MONTHS` function, see *Oracle Database SQL Language Reference*.

Example 4-29 Displaying a Date Six Months from a Selected Date

```
SELECT LAST_NAME,
       HIRE_DATE "Hired",
       ADD_MONTHS(HIRE_DATE, 6) "Evaluated"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY HIRE_DATE;
```

Result:

LAST_NAME	Hired	Evaluated
Faviet	16-AUG-94	16-FEB-95
Greenberg	17-AUG-94	17-FEB-95
Chen	28-SEP-97	28-MAR-98
Sciarra	30-SEP-97	31-MAR-98
Urman	07-MAR-98	07-SEP-98
Popp	07-DEC-99	07-JUN-00

6 rows selected.

The query in [Example 4-30](#) uses the `SYSTIMESTAMP` function to display the current system time and date. `SYSTIMESTAMP` is similar to `SYSDATE`, but it returns more information. For information about the `SYSTIMESTAMP` function, see *Oracle Database SQL Language Reference*.

The table in the `FROM` clause of the query, `DUAL`, is a one-row table that Oracle Database creates automatically along with the data dictionary. Select from `DUAL` when you want

to compute a constant expression with the `SELECT` statement. Because `DUAL` has only one row, the constant is returned only once. For more information about selecting from `DUAL`, see *Oracle Database SQL Language Reference*.

Example 4–30 Displaying System Date and Time

```
SELECT EXTRACT(HOUR FROM SYSTIMESTAMP) || ':' ||
EXTRACT(MINUTE FROM SYSTIMESTAMP) || ':' ||
ROUND(EXTRACT(SECOND FROM SYSTIMESTAMP), 0) || ', ' ||
EXTRACT(MONTH FROM SYSTIMESTAMP) || '/' ||
EXTRACT(DAY FROM SYSTIMESTAMP) || '/' ||
EXTRACT(YEAR FROM SYSTIMESTAMP) "System Time and Date"
FROM DUAL;
```

Results depend on current `SYSTIMESTAMP` value, but have this format:

```
System Time and Date
```

```
-----
18:47:33, 6/19/2008
```

See Also: *Oracle Database SQL Language Reference* for more information about SQL datetime functions

Using Conversion Functions in Queries

Conversion functions convert one data type to another. The conversion functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 4–31](#) uses the `TO_CHAR` function to convert `HIRE_DATE` values (which are of type `DATE`) to character values that have the format `FMMonth DD YYYY`. `FM` removes leading and trailing blanks from the month name. `FMMonth DD YYYY` is an example of a **datetime format model**.

Example 4–31 Converting Dates to Characters Using a Format Template

```
SELECT LAST_NAME,
HIRE_DATE,
TO_CHAR(HIRE_DATE, 'FMMonth DD YYYY') "Date Started"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	HIRE_DATE	Date Started
Chen	28-SEP-97	September 28 1997
Faviet	16-AUG-94	August 16 1994
Greenberg	17-AUG-94	August 17 1994
Popp	07-DEC-99	December 7 1999
Sciarra	30-SEP-97	September 30 1997
Urman	07-MAR-98	March 7 1998

6 rows selected.

The query in [Example 4–32](#) uses the `TO_CHAR` function to convert `HIRE_DATE` values to character values that have the two standard formats `DS` (Date Short) and `DL` (Date Long).

Example 4-32 Converting Dates to Characters Using Standard Formats

```

SELECT LAST_NAME,
       TO_CHAR(HIRE_DATE, 'DS') "Short Date",
       TO_CHAR(HIRE_DATE, 'DL') "Long Date"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY LAST_NAME;

```

Result:

LAST_NAME	Short Date	Long Date
Chen	9/28/1997	Sunday, September 28, 1997
Faviet	8/16/1994	Tuesday, August 16, 1994
Greenberg	8/17/1994	Wednesday, August 17, 1994
Popp	12/7/1999	Tuesday, December 07, 1999
Sciarra	9/30/1997	Tuesday, September 30, 1997
Urman	3/7/1998	Saturday, March 07, 1998

6 rows selected.

The query in [Example 4-33](#) uses the TO_CHAR function to convert SALARY values (which are of type NUMBER) to character values that have the format \$99,999.99.

Example 4-33 Converting Numbers to Characters Using a Format Template

```

SELECT LAST_NAME,
       TO_CHAR(SALARY, '$99,999.99') "Salary"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY SALARY;

```

Result:

LAST_NAME	Salary
Popp	\$6,900.00
Sciarra	\$7,700.00
Urman	\$7,800.00
Chen	\$8,200.00
Faviet	\$9,000.00
Greenberg	\$12,000.00

6 rows selected.

The query in [Example 4-34](#) uses the TO_NUMBER function to convert POSTAL_CODE values (which are of type VARCHAR2) to values of type NUMBER, which it uses in calculations.

Example 4-34 Converting Characters to Numbers

```

SELECT CITY,
       POSTAL_CODE "Old Code",
       TO_NUMBER(POSTAL_CODE) + 1 "New Code"
FROM LOCATIONS
WHERE COUNTRY_ID = 'US'
ORDER BY POSTAL_CODE;

```

Result:

CITY	Old Code	New Code
------	----------	----------

```
-----
Southlake                26192                26193
South Brunswick          50090                50091
Seattle                  98199                98200
South San Francisco      99236                99237
```

4 rows selected.

The query in [Example 4-35](#) uses the `TO_DATE` function to convert a string of characters whose format is `Month dd, YYYY, HH:MI A.M.` to a `DATE` value.

Example 4-35 Converting a Character String to a Date

```
SELECT TO_DATE('January 5, 2007, 8:43 A.M.',
'Month dd, YYYY, HH:MI A.M.') "Date"
FROM DUAL;
```

Result:

```
Date
-----
05-JAN-07
```

The query in [Example 4-36](#) uses the `TO_TIMESTAMP` function to convert a string of characters whose format is `DD-Mon-RR HH24:MI:SS.FF` to a `TIMESTAMP` value.

Example 4-36 Converting a Character String to a Time Stamp

```
SELECT TO_TIMESTAMP('May 5, 2007, 8:43 A.M.',
'Month dd, YYYY, HH:MI A.M.') "Timestamp"
FROM DUAL;
```

Result:

```
Timestamp
-----
05-MAY-07 08.43.00.000000000 AM
```

- *Oracle Database SQL Language Reference* for more information about SQL conversion functions
- *Oracle Database SQL Language Reference* for more information about the `TO_CHAR` function
- *Oracle Database SQL Language Reference* for more information about the `TO_NUMBER` function
- *Oracle Database SQL Language Reference* for more information about the `TO_DATE` function
- *Oracle Database SQL Language Reference* for more information about the `TO_TIMESTAMP` function
- ["About the NLS_DATE_FORMAT Parameter"](#) on page 9-14

Using Aggregate Functions in Queries

An aggregate function returns a single result row, based on a group of rows. The group of rows can be an entire table or view. The aggregate functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

Aggregate functions are especially powerful when used with the `GROUP BY` clause, which groups query results by one or more columns, with a result for each group.

The query in [Example 4-37](#) uses the `COUNT` function and the `GROUP BY` clause to show how many people report to each manager. The wildcard character, `*`, represents an entire record.

Example 4-37 Counting the Number of Rows in Each Group

```
SELECT MANAGER_ID "Manager",
COUNT(*) "Number of Reports"
FROM EMPLOYEES
GROUP BY MANAGER_ID;
```

Result:

Manager	Number of Reports
100	14
123	8
120	8
121	8
147	6
205	1
108	5
148	6
149	6
201	1

Manager	Number of Reports
102	1
101	5
114	5
124	8
145	6
146	6
103	4
122	8

19 rows selected.

[Example 4-37](#) shows that one employee does not report to a manager. The following query selects the first name, last name, and job title of that employee:

```
COLUMN FIRST_NAME FORMAT A10;
COLUMN LAST_NAME FORMAT A10;
COLUMN JOB_TITLE FORMAT A10;

SELECT e.FIRST_NAME,
e.LAST_NAME,
j.JOB_TITLE
FROM EMPLOYEES e, JOBS j
WHERE e.JOB_ID = j.JOB_ID
AND MANAGER_ID IS NULL;
```

Result:

FIRST_NAME	LAST_NAME	JOB_TITLE
-----	-----	-----

Steven King President

When used with the `DISTINCT` option, the `COUNT` function shows how many distinct values are in a data set.

The two queries in [Example 4-38](#) show the total number of departments and the number of departments that have employees.

Example 4-38 Counting the Number of Distinct Values in a Set

```
SELECT COUNT(*) FROM DEPARTMENTS;
```

Result:

```
COUNT(*)
-----
        27
```

```
SELECT COUNT(DISTINCT DEPARTMENT_ID) "Number of Departments"
FROM EMPLOYEES;
```

Result:

```
Number of Departments
-----
                11
```

The query in [Example 4-39](#) uses several aggregate functions to show statistics for the salaries of each `JOB_ID`.

Example 4-39 Using Aggregate Functions for Statistical Information

```
SELECT JOB_ID,
COUNT(*) "#",
MIN(SALARY) "Minimum",
ROUND(AVG(SALARY), 0) "Average",
MEDIAN(SALARY) "Median",
MAX(SALARY) "Maximum",
ROUND(STDDEV(SALARY)) "Std Dev"
FROM EMPLOYEES
GROUP BY JOB_ID
ORDER BY JOB_ID;
```

Result:

JOB_ID	#	Minimum	Average	Median	Maximum	Std Dev
AC_ACCOUNT	1	8300	8300	8300	8300	0
AC_MGR	1	12000	12000	12000	12000	0
AD_ASST	1	4400	4400	4400	4400	0
AD_PRES	1	24000	24000	24000	24000	0
AD_VP	2	17000	17000	17000	17000	0
FI_ACCOUNT	5	6900	7920	7800	9000	766
FI_MGR	1	12000	12000	12000	12000	0
HR_REP	1	6500	6500	6500	6500	0
IT_PROG	5	4200	5760	4800	9000	1926
MK_MAN	1	13000	13000	13000	13000	0
MK_REP	1	6000	6000	6000	6000	0
JOB_ID	#	Minimum	Average	Median	Maximum	Std Dev
PR_REP	1	10000	10000	10000	10000	0

PU_CLERK	5	2500	2780	2800	3100	239
PU_MAN	1	11000	11000	11000	11000	0
SA_MAN	5	10500	12200	12000	14000	1525
SA_REP	30	6100	8350	8200	11500	1524
SH_CLERK	20	2500	3215	3100	4200	548
ST_CLERK	20	2100	2785	2700	3600	453
ST_MAN	5	5800	7280	7900	8200	1066

19 rows selected.

To have the query return only rows where aggregate values meet specified conditions, use the HAVING clause.

The query in [Example 4-40](#) shows how much each department spends annually on salaries, but only for departments for which that amount exceeds \$1,000,000.

Example 4-40 Limiting Aggregate Functions to Rows that Satisfy a Condition

```
SELECT DEPARTMENT_ID "Department",
SUM(SALARY*12) "All Salaries"
FROM EMPLOYEES
HAVING SUM(SALARY * 12) >= 1000000
GROUP BY DEPARTMENT_ID;
```

Result:

```
Department All Salaries
-----
          50      1876800
          80      3654000
```

The RANK function returns the relative ordered rank of a number, and the PERCENT_RANK function returns the percentile position of a number.

The query in [Example 4-41](#) shows that a salary of \$3,000 is the 20th highest, and is in the 42nd percentile, among all clerks.

Example 4-41 Showing the Rank and Percentile of a Number Within a Group

```
SELECT RANK(3000) WITHIN GROUP
      (ORDER BY SALARY DESC) "Rank",
ROUND(100 * (PERCENT_RANK(3000) WITHIN GROUP
      (ORDER BY SALARY DESC)), 0) "Percentile"
FROM EMPLOYEES
WHERE JOB_ID LIKE '%CLERK';
```

Result:

```
Rank Percentile
-----
          20          42
```

The DENSE_RANK function is like the RANK function, except that the identical values have the same rank, and there are no gaps in the ranking. Using the DENSE_RANK function, \$3,000 is the 12th highest salary for clerks, as [Example 4-42](#) shows.

Example 4-42 Showing the Dense Rank of a Number Within a Group

```
SELECT DENSE_RANK(3000) WITHIN GROUP (ORDER BY salary DESC) "Rank"
FROM EMPLOYEES
WHERE JOB_ID LIKE '%CLERK';
```

Result:

```
      Rank
-----
      12
```

See Also: *Oracle Database SQL Language Reference* for more informaton about SQL aggregate functions

Using NULL-Related Functions in Queries

The NULL-related functions facilitate the handling of NULL values. The NULL-related functions that SQL supports are listed and described in *Oracle Database SQL Language Reference*.

The query in [Example 4-43](#) returns the last name and commission of the employees whose last names begin with 'B'. If an employee receives no commission (that is, if COMMISSION_PCT is NULL), the NVL function substitutes "Not Applicable" for NULL.

Example 4-43 Substituting a String for a NULL Value

```
SELECT LAST_NAME,
       NVL(TO_CHAR(COMMISSION_PCT), 'Not Applicable') "COMMISSION"
FROM EMPLOYEES
WHERE LAST_NAME LIKE 'B%'
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	COMMISSION
Baer	Not Applicable
Baida	Not Applicable
Banda	.1
Bates	.15
Bell	Not Applicable
Bernstein	.25
Bissot	Not Applicable
Bloom	.2
Bull	Not Applicable

9 rows selected.

The query in [Example 4-44](#) returns the last name, salary, and income of the employees whose last names begin with 'B', using the NVL2 function: If COMMISSION_PCT is not NULL, the income is the salary plus the commission; if COMMISSION_PCT is NULL, income is only the salary.

Example 4-44 Specifying Different Expressions for NULL and Not NULL Values

```
SELECT LAST_NAME, SALARY,
       NVL2(COMMISSION_PCT, SALARY + (SALARY * COMMISSION_PCT), SALARY) INCOME
FROM EMPLOYEES WHERE LAST_NAME LIKE 'B%'
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	SALARY	INCOME
Baer	10000	10000

Baida	2900	2900
Banda	6200	6882
Bates	7300	8468
Bell	4000	4000
Bernstein	9500	11970
Bissot	3300	3300
Bloom	10000	12100
Bull	4100	4100

9 rows selected.

See Also:

- *Oracle Database SQL Language Reference* for more information about the NVL function
- *Oracle Database SQL Language Reference* for more information about the NVL2 function

Using CASE Expressions in Queries

A CASE expression lets you use IF ... THEN ... ELSE logic in SQL statements without invoking procedures.

The query in [Example 4-45](#) uses a CASE expression to show proposed salary increases, based on length of service.

Example 4-45 Using a CASE Expression in a Query

```
SELECT LAST_NAME "Name",
       HIRE_DATE "Started",
       SALARY "Salary",
       CASE
         WHEN HIRE_DATE < TO_DATE('01-Jan-90') THEN TRUNC(SALARY*1.15, 0)
         WHEN HIRE_DATE < TO_DATE('01-Jan-95') THEN TRUNC(SALARY*1.10, 0)
         WHEN HIRE_DATE < TO_DATE('01-Jan-00') THEN TRUNC(SALARY*1.05, 0)
         ELSE SALARY
       END "Proposed Salary"
FROM EMPLOYEES
WHERE DEPARTMENT_ID = 100
ORDER BY HIRE_DATE;
```

Result:

Name	Started	Salary	Proposed Salary
Faviet	16-AUG-94	9000	9900
Greenberg	17-AUG-94	12000	13200
Chen	28-SEP-97	8200	8610
Sciarra	30-SEP-97	7700	8085
Urman	07-MAR-98	7800	8190
Popp	07-DEC-99	6900	7245

6 rows selected.

See Also:

- ["Using the CASE Statement"](#) on page 7-24
- *Oracle Database SQL Language Reference* for more information about CASE expressions

Using the DECODE Function in Queries

The DECODE function compares a value or expression to search values, and returns a result when it finds a match. If a match is not found, then DECODE returns the default value, or NULL (if a default value is not specified).

The query in [Example 4-46](#) uses the DECODE function to show proposed salary increases for three different jobs.

Example 4-46 Using the DECODE Function in a Query

```
SELECT LAST_NAME, JOB_ID, SALARY,  
       DECODE(JOB_ID,  
              'PU_CLERK', SALARY * 1.10,  
              'SH_CLERK', SALARY * 1.15,  
              'ST_CLERK', SALARY * 1.20,  
              SALARY) "Proposed Salary"  
FROM EMPLOYEES  
WHERE JOB_ID LIKE '%_CLERK'  
AND LAST_NAME < 'E'  
ORDER BY LAST_NAME;
```

Result:

LAST_NAME	JOB_ID	SALARY	Proposed Salary
Atkinson	ST_CLERK	2800	3360
Baida	PU_CLERK	2900	3190
Bell	SH_CLERK	4000	4600
Bissot	ST_CLERK	3300	3960
Bull	SH_CLERK	4100	4715
Cabrio	SH_CLERK	3000	3450
Chung	SH_CLERK	3800	4370
Colmenares	PU_CLERK	2500	2750
Davies	ST_CLERK	3100	3720
Dellinger	SH_CLERK	3400	3910
Dilly	SH_CLERK	3600	4140

11 rows selected.

See Also: *Oracle Database SQL Language Reference* for information about the DECODE function

About DML Statements and Transactions

This chapter contains the following topics:

- [About Data Manipulation Language \(DML\) Statements](#)
- [About Transaction Control Statements](#)
- [Committing Transactions](#)
- [Rolling Back Transactions](#)
- [Setting Savepoints in Transactions](#)

About Data Manipulation Language (DML) Statements

Data manipulation language (DML) statements access and manipulate data in existing tables.

In the SQL*Plus environment, you can enter a DML statement after the `SQL>` prompt.

In the SQL Developer environment, you can enter a DML statement in the SQL Worksheet. Alternatively, you can use the SQL Developer navigation frame and tools to access and manipulate data.

To see the effect of a DML statement in SQL Developer, you might have to click the Refresh icon.

The effect of a DML statement is not permanent until you commit the transaction that includes it. A **transaction** is a sequence of SQL statements that Oracle Database treats as a unit (it can be a single DML statement). Until a transaction is committed, it can be rolled back (undone). For more information about transactions, see "[About Transaction Control Statements](#)" on page 5-5.

Topics:

- [About the INSERT Statement](#)
- [About the UPDATE Statement](#)
- [About the DELETE Statement](#)

See Also: *Oracle Database SQL Language Reference* for more information about DML statements

About the INSERT Statement

The INSERT statement inserts rows into an existing table.

The simplest recommended form of the INSERT statement has this syntax:

```
INSERT INTO table_name (list_of_columns)
VALUES (list_of_values);
```

Every column in *list_of_columns* must have a valid value in the corresponding position in *list_of_values*. Therefore, before you insert a row into a table, you must know what columns the table has, and what their valid values are. To get this information using SQL Developer, see ["Tutorial: Viewing EMPLOYEES Table Properties and Data"](#) on page 3-2. To get this information using SQL*Plus, use the DESCRIBE statement. For example:

```
DESCRIBE EMPLOYEES;
```

Result:

Name	Null?	Type
-----	-----	-----
EMPLOYEE_ID	NOT NULL	NUMBER(6)
FIRST_NAME		VARCHAR2(20)
LAST_NAME	NOT NULL	VARCHAR2(25)
EMAIL	NOT NULL	VARCHAR2(25)
PHONE_NUMBER		VARCHAR2(20)
HIRE_DATE	NOT NULL	DATE
JOB_ID	NOT NULL	VARCHAR2(10)
SALARY		NUMBER(8,2)
COMMISSION_PCT		NUMBER(2,2)
MANAGER_ID		NUMBER(6)
DEPARTMENT_ID		NUMBER(4)

The INSERT statement in [Example 5-1](#) inserts a row into the EMPLOYEES table for an employee for which all column values are known.

Example 5-1 Using the INSERT Statement When All Information Is Available

```
INSERT INTO EMPLOYEES (
    EMPLOYEE_ID,
    FIRST_NAME,
    LAST_NAME,
    EMAIL,
    PHONE_NUMBER,
    HIRE_DATE,
    JOB_ID,
    SALARY,
    COMMISSION_PCT,
    MANAGER_ID,
    DEPARTMENT_ID
)
VALUES (
    10,                -- EMPLOYEE_ID
    'George',         -- FIRST_NAME
    'Gordon',         -- LAST_NAME
    'GGORDON',        -- EMAIL
    '650.506.2222',   -- PHONE_NUMBER
    '01-JAN-07',      -- HIRE_DATE
    'SA_REP',         -- JOB_ID
    9000,             -- SALARY
```

```
.1,          -- COMMISSION_PCT
148,        -- MANAGER_ID
80          -- DEPARTMENT_ID
);
```

Result:

1 row created.

You do not need to know all column values to insert a row into a table, but you must know the values of all NOT NULL columns. If you do not know the value of a column that can be NULL, you can omit that column from *list_of_columns*. Its value defaults to NULL.

The INSERT statement in [Example 5–2](#) inserts a row into the EMPLOYEES table for an employee for which all column values are known except SALARY. For now, SALARY can have the value NULL. When you know the salary, you can change it with the UPDATE statement (see [Example 5–4](#)).

Example 5–2 Using the INSERT Statement When Not All Information Is Available

```
INSERT INTO EMPLOYEES (
    EMPLOYEE_ID,
    FIRST_NAME,
    LAST_NAME,
    EMAIL,
    PHONE_NUMBER,
    HIRE_DATE,
    JOB_ID,          -- Omit SALARY; its value defaults to NULL.
    COMMISSION_PCT,
    MANAGER_ID,
    DEPARTMENT_ID
)
VALUES (
    20,              -- EMPLOYEE_ID
    'John',          -- FIRST_NAME
    'Keats',          -- LAST_NAME
    'JKEATS',        -- EMAIL
    '650.506.3333',  -- PHONE_NUMBER
    '01-JAN-07',     -- HIRE_DATE
    'SA_REP',        -- JOB_ID
    .1,              -- COMMISSION_PCT
    148,             -- MANAGER_ID
    80               -- DEPARTMENT_ID
);
```

Result:

1 row created.

The INSERT statement in [Example 5–3](#) tries to insert a row into the EMPLOYEES table for an employee for which LAST_NAME is not known.

Example 5–3 Using the INSERT Statement Incorrectly

```
INSERT INTO EMPLOYEES (
    EMPLOYEE_ID,
    FIRST_NAME,      -- Omit LAST_NAME (error)
    EMAIL,
    PHONE_NUMBER,
    HIRE_DATE,
```

```
JOB_ID,  
COMMISSION_PCT,  
MANAGER_ID,  
DEPARTMENT_ID  
)  
VALUES (  
  20,          -- EMPLOYEE_ID  
  'John',      -- FIRST_NAME  
  'JOHN',      -- EMAIL  
  '650.506.3333', -- PHONE_NUMBER  
  '01-JAN-07', -- HIRE_DATE  
  'SA_REP',    -- JOB_ID  
  .1,          -- COMMISSION_PCT  
  148,         -- MANAGER_ID  
  80           -- DEPARTMENT_ID  
);
```

Result:

ORA-01400: cannot insert NULL into ("HR"."EMPLOYEES"."LAST_NAME")

See Also:

- *Oracle Database SQL Language Reference* for information about the **INSERT** statement
- *Oracle Database SQL Language Reference* for information about data types
- ["Tutorial: Adding Rows to Tables with the Insert Row Tool"](#) on page 6-11

About the UPDATE Statement

The **UPDATE** statement updates (changes the values of) a set of existing table rows.

A simple form of the **UPDATE** statement has this syntax:

```
UPDATE table_name  
SET column_name = value [, column_name = value]...  
[ WHERE condition ];
```

Each *value* must be valid for its *column_name*. If you include the **WHERE** clause, the statement updates column values only in rows that satisfy *condition*.

The **UPDATE** statement in [Example 5-4](#) updates the value of the **SALARY** column in the row that was inserted into the **EMPLOYEES** table in [Example 5-2](#), before the salary of the employee was known.

Example 5-4 Using the UPDATE Statement to Add Data

```
UPDATE EMPLOYEES  
SET SALARY = 8500  
WHERE LAST_NAME = 'Keats';
```

Result:

1 row updated.

The **UPDATE** statement in [Example 5-5](#) updates the commission percentage for every employee in department 80.

Example 5-5 Using the UPDATE Statement to Update Multiple Rows

```
UPDATE EMPLOYEES
SET COMMISSION_PCT = COMMISSION_PCT + 0.05
WHERE DEPARTMENT_ID = 80;
```

Result:

36 rows updated.

See Also:

- *Oracle Database SQL Language Reference* for information about the UPDATE statement
- *Oracle Database SQL Language Reference* for information about data types
- ["Tutorial: Changing Data in Tables in the Data Pane"](#) on page 6-12

About the DELETE Statement

The DELETE statement deletes rows from a table.

A simple form of the DELETE statement has this syntax:

```
DELETE FROM table_name
[ WHERE condition ];
```

If you include the WHERE clause, the statement deletes only rows that satisfy *condition*. If you omit the WHERE clause, the statement deletes all rows from the table, but the empty table still exists. To delete a table, use the DROP TABLE statement.

The DELETE statement in [Example 5-6](#) deletes the rows inserted in [Example 5-1](#) and [Example 5-2](#).

Example 5-6 Using the DELETE Statement

```
DELETE FROM EMPLOYEES
WHERE HIRE_DATE = '01-JAN-07';
```

Result:

2 rows deleted.

See Also:

- *Oracle Database SQL Language Reference* for information about the DELETE statement
- *Oracle Database SQL Language Reference* for information about the DROP TABLE statement
- ["Tutorial: Deleting Rows from Tables with the Delete Selected Row\(s\) Tool"](#) on page 6-13

About Transaction Control Statements

A **transaction** is a sequence of one or more SQL statements that Oracle Database treats as a unit: either all of the statements are performed, or none of them are.

You need transactions to model business processes that require that several operations be performed as a unit. For example, when a manager leaves the company, a row must be inserted into the JOB_HISTORY table to show when the manager left, and for every

employee who reports to that manager, the value of `MANAGER_ID` must be updated in the `EMPLOYEES` table. To model this process in an application, you must group the `INSERT` and `UPDATE` statements into a single transaction.

The basic **transaction control statements** are:

- `SAVEPOINT`, which marks a **savepoint** in a transaction—a point to which you can later roll back. Savepoints are optional, and a transaction can have multiple savepoints.
- `COMMIT`, which ends the current transaction, makes its changes permanent, erases its savepoints, and releases its locks.
- `ROLLBACK`, which rolls back (undoes) either the entire current transaction or only the changes made after the specified savepoint.

In the SQL*Plus environment, you can enter a transaction control statement after the `SQL>` prompt.

In the SQL Developer environment, you can enter a transaction control statement in the SQL Worksheet. SQL Developer also has Commit Changes and Rollback Changes icons, which are explained in ["Committing Transactions"](#) on page 5-6 and ["Rolling Back Transactions"](#) on page 5-8.

Caution: If you do not explicitly commit a transaction, and the program terminates abnormally, then the database automatically rolls back the last uncommitted transaction.

Oracle recommends that you explicitly end transactions in application programs, by either committing them or rolling them back.

See Also:

- *Oracle Database Concepts* for more information about transaction management
- *Oracle Database SQL Language Reference* for more information about transaction control statements

Committing Transactions

Committing a transaction makes its changes permanent, erases its savepoints, and releases its locks.

To explicitly commit a transaction, use either the `COMMIT` statement or (in the SQL Developer environment) the Commit Changes icon.

Note: Oracle Database issues an implicit `COMMIT` statement before and after any data definition language (DDL) statement. For information about DDL statements, see ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1.

Before you commit a transaction:

- Your changes are visible to you, but not to other users of the database instance.
- Your changes are not final—you can undo them with a `ROLLBACK` statement.

After you commit a transaction:

- Your changes are visible to other users, and to their statements that run after you commit your transaction.
- Your changes are final—you cannot undo them with a `ROLLBACK` statement.

[Example 5-7](#) adds one row to the `REGIONS` table (a very simple transaction), checks the result, and then commits the transaction.

Example 5-7 Committing a Transaction

Before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
```

Transaction (add row to table):

```
INSERT INTO regions (region_id, region_name) VALUES (5, 'Africa');
```

Result:

1 row created.

Check that row was added:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```
REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
5 Africa
```

Commit transaction:

```
COMMIT;
```

Result:

Commit complete.

See Also: *Oracle Database SQL Language Reference* for information about the `COMMIT` statement

Rolling Back Transactions

Rolling back a transaction undoes its changes. You can roll back the entire current transaction, or you can roll it back only to a specified savepoint.

To roll back the current transaction only to a specified savepoint, you must use the `ROLLBACK` statement with the `TO SAVEPOINT` clause.

To roll back the entire current transaction, use either the `ROLLBACK` statement without the `TO SAVEPOINT` clause, or (in the SQL Developer environment) the Rollback Changes icon.

Rolling back the entire current transaction:

- Ends the transaction
- Reverses all of its changes
- Erases all of its savepoints
- Releases any transaction locks

Rolling back the current transaction only to the specified savepoint:

- Does not end the transaction
- Reverses only the changes made after the specified savepoint
- Erases only the savepoints set after the specified savepoint (excluding the specified savepoint itself)
- Releases all table and row locks acquired after the specified savepoint

Other transactions that have requested access to rows locked after the specified savepoint must continue to wait until the transaction is either committed or rolled back. Other transactions that have not requested the rows can request and access the rows immediately.

To see the effect of a rollback in SQL Developer, you might have to click the Refresh icon.

As a result of [Example 5-7](#), the `REGIONS` table has a region called 'Middle East and Africa' and a region called 'Africa'. [Example 5-8](#) corrects this problem (a very simple transaction) and checks the change, but then rolls back the transaction and checks the rollback.

Example 5-8 Rolling Back an Entire Transaction

Before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

```

REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
5 Africa

```

Transaction (change table):

```

UPDATE REGIONS
SET REGION_NAME = 'Middle East'
WHERE REGION_NAME = 'Middle East and Africa';

```

Result:

1 row updated.

Check change:

```

SELECT * FROM REGIONS
ORDER BY REGION_ID;

```

Result:

```

REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East
5 Africa

```

Roll back transaction:

```
ROLLBACK;
```

Result:

Rollback complete.

Check rollback:

```

SELECT * FROM REGIONS
ORDER BY REGION_ID;

```

Result:

```

REGION_ID REGION_NAME
-----
1 Europe
2 Americas
3 Asia
4 Middle East and Africa
5 Africa

```

See Also: *Oracle Database SQL Language Reference* for information about the ROLLBACK statement

Setting Savepoints in Transactions

The `SAVEPOINT` statement marks a **savepoint** in a transaction—a point to which you can later roll back. Savepoints are optional, and a transaction can have multiple savepoints.

[Example 5–9](#) does a transaction that includes several DML statements and several savepoints, and then rolls back the transaction to one savepoint, undoing only the changes made after that savepoint.

Example 5–9 Rolling Back a Transaction to a Savepoint

Check `REGIONS` table before transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

REGION_ID	REGION_NAME
1	Europe
2	Americas
3	Asia
4	Middle East and Africa
5	Africa

5 rows selected.

Check countries in region 4 before transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
Egypt	EG	4
Israel	IL	4
Kuwait	KW	4
Nigeria	NG	4
Zambia	ZM	4
Zimbabwe	ZW	4

6 rows selected.

Check countries in region 5 before transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

no rows selected

Transaction, with several savepoints:

```
UPDATE REGIONS
```

```
SET REGION_NAME = 'Middle East'
WHERE REGION_NAME = 'Middle East and Africa';
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'ZM';
SAVEPOINT zambia;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'NG';
SAVEPOINT nigeria;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'ZW';
SAVEPOINT zimbabwe;
```

```
UPDATE COUNTRIES
  SET REGION_ID = 5
  WHERE COUNTRY_ID = 'EG';
SAVEPOINT egypt;
```

Check REGIONS table after transaction:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

REGION_ID	REGION_NAME
1	Europe
2	Americas
3	Asia
4	Middle East
5	Africa

5 rows selected.

Check countries in region 4 after transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
Israel	IL	4
Kuwait	KW	4

2 rows selected.

Check countries in region 5 after transaction:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
-----	---	-----
Egypt	EG	5
Nigeria	NG	5
Zambia	ZM	5
Zimbabwe	ZW	5

4 rows selected.

ROLLBACK TO SAVEPOINT nigeria;

Check REGIONS table after rollback:

```
SELECT * FROM REGIONS
ORDER BY REGION_ID;
```

Result:

REGION_ID	REGION_NAME
-----	-----
1	Europe
2	Americas
3	Asia
4	Middle East
5	Africa

5 rows selected.

Check countries in region 4 after rollback:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 4
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
-----	---	-----
Egypt	EG	4
Israel	IL	4
Kuwait	KW	4
Zimbabwe	ZW	4

4 rows selected.

Check countries in region 5 after rollback:

```
SELECT COUNTRY_NAME, COUNTRY_ID, REGION_ID
FROM COUNTRIES
WHERE REGION_ID = 5
ORDER BY COUNTRY_NAME;
```

Result:

COUNTRY_NAME	CO	REGION_ID
-----	---	-----
Nigeria	NG	5
Zambia	ZM	5

2 rows selected.

Creating and Managing Schema Objects

This chapter contains the following topics:

- [About Data Definition Language \(DDL\) Statements](#)
- [About Schema Object Names](#)
- [Creating and Managing Tables](#)
- [Creating and Managing Views](#)
- [Creating and Managing Sequences](#)
- [Creating and Managing Synonyms](#)

About Data Definition Language (DDL) Statements

The statements that create, change, and drop schema objects are **data definition language (DDL) statements**. Before and after a DDL statement, Oracle Database issues an implicit `COMMIT` statement; therefore, you cannot roll back a DDL statement.

In the SQL*Plus environment, you can enter a DDL statement after the `SQL>` prompt.

In the SQL Developer environment, you can enter a DDL statement in the SQL Worksheet. Alternatively, you can use SQL Developer tools to create, change, and drop objects.

Some DDL statements that create schema objects have an optional `OR REPLACE` clause, which allows a statement to replace an existing schema object with another that has the same name and type. When SQL Developer generates code for one of these statements, it always includes the `OR REPLACE` clause.

To see the effect of a DDL statement in SQL Developer, you might have to click the Refresh icon.

See Also:

- *Oracle Database SQL Language Reference* for more information about DDL statements
- ["Committing Transactions"](#) on page 5-6

About Schema Object Names

When creating schema objects, you must observe the schema object naming rules in *Oracle Database SQL Language Reference*.

Tip: Use the same prefix for names of objects of the same type. For example, `t_` for tables, `v_` for views, `seq_` for sequences, and `syn_` for synonyms. This practice makes your objects easy to identify, and groups them in the SQL Developer Connections navigator display, SQL Developer reports, and queries whose results are ordered by object name.

Creating and Managing Tables

Tables are the basic units of data storage in Oracle Database. Tables hold all user-accessible data. Each table contains rows that represent individual data records. Rows are composed of columns that represent the fields of the records.

Topics:

- [About SQL Data Types](#)
- [Creating Tables](#)
- [Ensuring Data Integrity in Tables](#)
- [Tutorial: Adding Rows to Tables with the Insert Row Tool](#)
- [Tutorial: Changing Data in Tables in the Data Pane](#)
- [Tutorial: Deleting Rows from Tables with the Delete Selected Row\(s\) Tool](#)
- [Managing Indexes](#)
- [Dropping Tables](#)

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user `HR` from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6.

See Also:

- ["Tutorial: Viewing EMPLOYEES Table Properties and Data"](#) on page 3-2
- *Oracle Database Concepts* for general information about tables

About SQL Data Types

When you create a table, you must specify the SQL data type for each column. The data type of a column determines what values the column can contain. For example, a column of type `DATE` can contain the value `'01-MAY-05'`, but it cannot contain the numeric value `2` or the character value `'shoe'`. SQL data types fall into two categories: built-in and user-defined. (PL/SQL has additional data types—see ["About PL/SQL Data Types"](#) on page 7-4.)

See Also:

- *Oracle Database SQL Language Reference* for a summary of built-in SQL data types
- *Oracle Database Concepts* for introductions to each of the built-in SQL data types
- *Oracle Database SQL Language Reference* for more information about user-defined data types
- ["About PL/SQL Data Types"](#) on page 7-4

Creating Tables

To create tables, use either the SQL Developer tool Create Table or the DDL statement `CREATE TABLE`. This topic shows how to use both of these ways to create these tables, which will contain data about employee evaluations:

- `PERFORMANCE_PARTS`, which contains the categories of employee performance that are evaluated and their relative weights
- `EVALUATIONS`, which contains employee information, evaluation date, job, manager, and department
- `SCORES`, which contains the scores assigned to each performance category for each evaluation

These tables are part of the sample application that the tutorials and examples in this document show how to develop and deploy.

Topics:

- [Tutorial: Creating a Table with the Create Table Tool](#)
- [Creating Tables with the `CREATE TABLE` Statement](#)

Tutorial: Creating a Table with the Create Table Tool

This tutorial shows how to create the `PERFORMANCE_PARTS` table using the Create Table tool.

To create the `PERFORMANCE_PARTS` table using the Create Table tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Right-click **Tables**.
A list of choices appears.
3. Click **New Table**.
The Create Table window opens, with default values for a new table, which has only one row.
4. For Schema, accept the default value, `HR`.
5. For Name, enter `PERFORMANCE_PARTS`.
6. In the default row:
 - For Column Name, enter `PERFORMANCE_ID`.
 - For Type, accept the default value, `VARCHAR2`.

- For Size, enter 2.
 - For Not Null and Primary Key, accept the default values, deselected.
7. Click **Add Column**.
 8. For Column Name, enter NAME.
 9. For Type, enter VARCHAR2.
 10. For Size, enter 80.
 11. Click **Add Column**.
 12. For Column Name, enter WEIGHT.
 13. For Type, enter NUMBER.
 14. Click **OK**.

The table PERFORMANCE_PARTS is created. To see it, expand Tables in the navigation frame.

See Also: *Oracle Database SQL Developer User's Guide* for more information about using SQL Developer to create tables

Creating Tables with the CREATE TABLE Statement

This topic shows how to use the CREATE TABLE statement to create the EVALUATIONS and SCORES tables.

The CREATE TABLE statement in [Example 6–1](#) creates the EVALUATIONS table.

Example 6–1 Creating the EVALUATIONS Table with CREATE TABLE

```
CREATE TABLE EVALUATIONS (  
    EVALUATION_ID    NUMBER(8,0),  
    EMPLOYEE_ID      NUMBER(6,0),  
    EVALUATION_DATE   DATE,  
    JOB_ID            VARCHAR2(10),  
    MANAGER_ID        NUMBER(6,0),  
    DEPARTMENT_ID     NUMBER(4,0),  
    TOTAL_SCORE       NUMBER(3,0)  
);
```

Result:

Table created.

The CREATE TABLE statement in [Example 6–2](#) creates the SCORES table.

Example 6–2 Creating the SCORES Table with CREATE TABLE

```
CREATE TABLE SCORES (  
    EVALUATION_ID    NUMBER(8,0),  
    PERFORMANCE_ID   VARCHAR2(2),  
    SCORE             NUMBER(1,0)  
);
```

Result:

Table created.

In SQL Developer, in the navigation frame, if you expand Tables, you can see the tables EVALUATIONS and SCORES.

If you select a table in the navigation frame, and then click the tab SQL in the right frame, the SQL pane shows the SQL statement that created the table.

See Also: *Oracle Database SQL Language Reference* for information about the `CREATE TABLE` statement

Ensuring Data Integrity in Tables

To ensure that the data in your tables satisfies the business rules that your application models, you can use constraints, application logic, or both.

Constraints restrict the values that columns can have. Trying to change the data in a way that violates a constraint causes an error and rolls back the change. Trying to add a constraint to a populated table causes an error if existing data violates the constraint.

Tip: Wherever possible, use constraints instead of application logic. Oracle Database checks that all data obeys constraints much faster than application logic can.

Constraints can be enabled and disabled. By default, they are created in the enabled state.

Topics:

- [About Constraint Types](#)
- [Tutorial: Adding Constraints to Existing Tables](#)

See Also:

- *Oracle Database Concepts* for additional general information about constraints
- *Oracle Database SQL Language Reference* for syntactic information about constraints
- ["Installing the Sample Application"](#) on page 10-12

About Constraint Types

The constraint types are:

- **Not Null**, which prevents a value from being null

In the `EMPLOYEES` table, the column `LAST_NAME` has the `NOT NULL` constraint, which enforces the business rule that every employee must have a last name.

- **Unique**, which prevents multiple rows from having the same value in the same column or combination of columns, but allows some values to be null

In the `EMPLOYEES` table, the column `EMAIL` has the `UNIQUE` constraint, which enforces the business rule that an employee can have no email address, but cannot have the same email address as another employee.

- **Primary Key**, which is a combination of `NOT NULL` and `UNIQUE`

In the `EMPLOYEES` table, the column `EMPLOYEE_ID` has the `PRIMARY KEY` constraint, which enforces the business rule that every employee must have a unique employee identification number.

- **Foreign Key**, which requires values in one table to match values in another table

In the `EMPLOYEES` table, the column `JOB_ID` has a `FOREIGN KEY` constraint that references the `JOBS` table, which enforces the business rule that an employee cannot have a `JOB_ID` that is not in the `JOBS` table.

- **Check**, which requires that a value satisfy a specified condition

The `EMPLOYEES` table does not have `CHECK` constraints. However, suppose that `EMPLOYEES` needs a new column, `EMPLOYEE_AGE`, and that every employee must be at least 18. The constraint `CHECK (EMPLOYEE_AGE >= 18)` enforces the business rule.

Tip: Use check constraints only when other constraint types cannot provide the necessary checking.

- **REF**, which further describes the relationship between the column and the object that it references

For information about `REF` constraints, see *Oracle Database Concepts*.

See Also:

- *Oracle Database Concepts* for additional general information about constraint types
- *Oracle Database SQL Language Reference* for syntactic information about constraints

Tutorial: Adding Constraints to Existing Tables

To add constraints to existing tables, use either SQL Developer tools or the DDL statement `ALTER TABLE`. This topic shows how to use both of these ways to add constraints to the tables created in ["Creating Tables"](#) on page 6-3.

This tutorial has several procedures. The first procedure (immediately after this paragraph) uses the Edit Table tool to add a Not Null constraint to the `NAMES` column of the `PERFORMANCE_PARTS` table. The remaining procedures show how to use other tools to add constraints; however, you could add the same constraints using the Edit Table tool.

Note: After any step of the tutorial, you can view the constraints that a table has:

1. In the navigation frame, select the name of the table.
2. In the right frame, click the tab **Constraints**.

For more information about viewing table properties and data, see ["Tutorial: Viewing EMPLOYEES Table Properties and Data"](#) on page 3-2.

To add a Not Null constraint using the Edit Table tool:

1. On the Connections tab, expand **hr_conn**.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Tables**.

A list of tables appears.

3. Right-click **PERFORMANCE_PARTS**.

A list of choices appears.

4. Click **Edit**.

The Edit Table window opens. By default, Columns is selected, the columns of the PERFORMANCE_PARTS table are listed, the column PERFORMANCE_ID is selected, and its properties are listed.

5. Click the column **NAME**.

The properties of the column NAME appear. The property "Cannot be NULL" is deselected.

6. Select **Cannot be NULL**.

7. Click **OK**.

The Not Null constraint is added to the NAME column of the PERFORMANCE_PARTS table.

The following procedure uses the ALTER TABLE statement to add a Not Null constraint to the WEIGHT column of the PERFORMANCE_PARTS table.

To add a Not Null constraint using the ALTER TABLE statement:

1. Click the icon **SQL Worksheet**.

The SQL Worksheet pane appears.

2. In the SQL Worksheet pane, type this statement:

```
ALTER TABLE PERFORMANCE_PARTS
MODIFY WEIGHT NOT NULL;
```

3. Click the icon **Execute Statement**.

The statement runs, adding the Not Null constraint to the WEIGHT column of the PERFORMANCE_PARTS table.

The following procedure uses the Add Unique tool to add a Unique constraint to the SCORES table.

To add a Unique constraint using the Add Unique tool:

1. On the Connections tab, expand **hr_conn**.

Under the hr_conn icon, a list of schema object types appears.

2. Expand **Tables**.

A list of tables appears.

3. Right-click **SCORES**.

A list of choices appears.

4. Click **Constraint**.

A list of choices appears.

5. Click **Add Unique**.

The Add Unique window opens.

6. For Constraint Name, enter SCORES_EVAL_PERF_UNIQUE.

7. For Column 1, select EVALUATION_ID from the drop-down menu.

8. For Column 2, select PERFORMANCE_ID from the drop-down menu.

9. Click **Apply**.

The Confirmation window opens.

10. Click OK.

A unique constraint named SCORES_EVAL_PERF_UNIQUE is added to the SCORES table.

The following procedure uses the Add Primary Key tool to add a Primary Key constraint to the PERFORMANCE_ID column of the PERFORMANCE_PARTS table.

To add a Primary Key constraint using the Add Primary Key tool:**1. On the Connections tab, expand hr_conn.**

Under the hr_conn icon, a list of schema object types appears.

2. Expand Tables.

A list of tables appears.

3. Right-click PERFORMANCE_PARTS.

A list of choices appears.

4. Click Constraint.

A list of choices appears.

5. Click Add Primary Key.

The Add Primary Key window opens.

6. For Primary Key Name, enter PERF_PERF_ID_PK.**7. For Column 1, select PERFORMANCE_ID from the drop-down menu.****8. Click Apply.**

The Confirmation window opens.

9. Click OK.

A primary key constraint named PERF_PERF_ID_PK is added to the PERFORMANCE_ID column of the PERFORMANCE_PARTS table.

The following procedure uses the ALTER TABLE statement to add a Primary Key constraint to the EVALUATION_ID column of the EVALUATIONS table.

To add a Primary Key constraint using the ALTER TABLE statement:**1. Click the icon SQL Worksheet.**

The SQL Worksheet pane appears. Under "Enter SQL Statement:" is a field where you can enter a SQL statement.

2. In the SQL Worksheet pane, type this statement:

```
ALTER TABLE EVALUATIONS
ADD CONSTRAINT EVAL_EVAL_ID_PK PRIMARY KEY (EVALUATION_ID);
```

3. Click the icon Execute Statement.

The statement runs, adding the Primary Key constraint to the EVALUATION_ID column of the EVALUATIONS table.

The following procedure uses the Add Foreign Key tool to add two Foreign Key constraints to the SCORES table.

To add two Foreign Key constraints using the Add Foreign Key tool:**1. On the Connections tab, expand hr_conn.**

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand `Tables`.

A list of tables appears.

3. Right-click `SCORES`.

A list of choices appears.

4. Click `Constraint`.

A list of choices appears.

5. Click `Add Foreign Key`.

The Add Foreign Key window opens.

6. For Foreign Key Name, enter `SCORES_EVAL_FK`.

7. For Column Name, select `EVALUATION_ID` from the drop-down menu.

8. For Reference Table Name, select `EVALUATIONS` from the drop-down menu.

9. For Referencing Column, select `EVALUATION_ID` from the drop-down menu.

10. Click `Apply`.

The Confirmation window opens.

11. Click `OK`.

A foreign key constraint named `SCORES_EVAL_FK` is added to the `EVALUATION_ID` column of the `SCORES` table, referencing the `EVALUATION_ID` column of the `EVALUATIONS` table.

The following steps add another foreign key constraint to the `SCORES` table.

12. Right-click `SCORES`.

A list of tables appears.

13. Click `Constraint`.

A list of choices appears.

14. Click `Add Foreign Key`.

The Add Foreign Key window opens.

15. For Foreign Key Name, enter `SCORES_PERF_FK`.

16. For Column Name, select `PERFORMANCE_ID` from the drop-down menu.

17. For Reference Table Name, select `PERFORMANCE_PARTS` from the drop-down menu.

18. For Referencing Column, select `PERFORMANCE_ID` from the drop-down menu.

19. Click `Apply`.

The Confirmation window opens.

20. Click `OK`.

A foreign key constraint named `SCORES_PERF_FK` is added to the `EVALUATION_ID` column of the `SCORES` table, referencing the `EVALUATION_ID` column of the `EVALUATIONS` table.

The following procedure uses the `ALTER TABLE` statement to add a Foreign Key constraint to the `EMPLOYEE_ID` column of the `EVALUATIONS` table, referencing the `EMPLOYEE_ID` column of the `EMPLOYEES` table.

To add a Foreign Key constraint using the ALTER TABLE statement:

1. Click the icon **SQL Worksheet**.

The SQL Worksheet pane appears. Under "Enter SQL Statement:" is a field where you can enter a SQL statement.

2. In the SQL Worksheet pane, type this statement:

```
ALTER TABLE EVALUATIONS
ADD CONSTRAINT EVAL_EMP_ID_FK FOREIGN KEY (EMPLOYEE_ID)
REFERENCES EMPLOYEES (EMPLOYEE_ID);
```

3. Click the icon **Execute Statement**.

The statement runs, adding the Foreign Key constraint to the `EMPLOYEE_ID` column of the `EVALUATIONS` table, referencing the `EMPLOYEE_ID` column of the `EMPLOYEES` table.

The following procedure uses the Add Check tool to add a Check constraint to the `SCORES` table.

To add a Check constraint using the Add Check tool:

1. On the Connections tab, expand **hr_conn**.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Tables**.

A list of tables appears.

3. Right-click **SCORES**.

A list of choices appears.

4. Click **Constraint**.

A list of choices appears.

5. Click **Add Check**.

The Add Check window opens.

6. For Constraint Name, enter `SCORE_VALID`.

7. For Check Condition, enter `score >= 0 and score <= 9`.

8. For Status, accept the default, `ENABLE`.

9. Click **Apply**.

The Confirmation window opens.

10. Click **OK**.

A Check constraint named `SCORE_VALID` is added to the `SCORES` table.

See Also:

- *Oracle Database SQL Language Reference* for more information about the `ALTER TABLE` statement

- *Oracle Database SQL Language Reference* for information about adding constraints to a table when you create it with the `CREATE TABLE` statement

Tutorial: Adding Rows to Tables with the Insert Row Tool

This tutorial shows how to use the Insert Row tool to add six populated rows to the `PERFORMANCE_PARTS` table (created in "[Tutorial: Creating a Table with the Create Table Tool](#)" on page 6-3).

To add rows to the `PERFORMANCE_PARTS` table using the Insert Row tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Tables**.
A list of tables appears.
3. Select **`PERFORMANCE_PARTS`**.
4. In the right frame, click the tab **Data**.
The Data pane appears, showing the names of the columns of the `PERFORMANCE_PARTS` table and no rows.
5. In the Data pane, click the icon **Insert Row**.
A new row appears, with empty columns.
6. Click the cell under the column heading `PERFORMANCE_ID`.
7. Type `WM`.
The value of `PERFORMANCE_ID` is now `WM`.
8. Either press the key **Tab** or click the cell under the column heading `NAME`.
9. Type Workload Management.
The value of `NAME` is now Workload Management.
10. Either press the key **Tab** or click the cell under the column heading `WEIGHT`.
11. Type `0.2`.
12. Press the key **Enter**.
The value of `WEIGHT` is now `0.2`.
13. Add and populate a second row by repeating steps 5 through 12 with these values:
 - For `PERFORMANCE_ID`, type `BR`.
 - For `NAME`, type Building Relationships.
 - For `WEIGHT`, type `0.2`.
14. Add and populate a third row by repeating steps 5 through 12 with these values:

- For PERFORMANCE_ID, type CF.
 - For NAME, type Customer Focus.
 - For WEIGHT, type 0.2.
15. Add and populate a fourth row by repeating steps 5 through 12 with these values:
- For PERFORMANCE_ID, type CM.
 - For NAME, type Communication.
 - For WEIGHT, type 0.2.
16. Add and populate a fifth row by repeating steps 5 through 12 with these values:
- For PERFORMANCE_ID, type TW.
 - For NAME, type Teamwork.
 - For WEIGHT, type 0.2.
17. Add and populate a sixth row by repeating steps 5 through 12, using these values:
- For PERFORMANCE_ID, type RO.
 - For NAME, type Results Orientation.
 - For WEIGHT, type 0.2.
18. Click the icon **Commit Changes**.
- Under the Data pane is the Data Editor Log pane.
19. Check the Data Editor Log pane for the message "Commit Successful".
20. Check the new rows in the Data Pane.

See Also: ["About the INSERT Statement"](#) on page 5-2

Tutorial: Changing Data in Tables in the Data Pane

This tutorial shows how to change three of the WEIGHT values in the PERFORMANCE_PARTS table (populated in ["Tutorial: Adding Rows to Tables with the Insert Row Tool"](#) on page 6-11) in the Data pane.

To change data in the PERFORMANCE_PARTS table using the Data pane:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Tables**.
A list of tables appears.
3. Select **PERFORMANCE_PARTS**.
4. In the right frame, click the tab **Data**.
The Data pane appears, showing the rows of the PERFORMANCE_PARTS table.
5. In the row where NAME is Workload Management:
 1. Click the WEIGHT value.
 2. Enter the value 0.3.
 3. Press the key **Enter**.
6. In the row where NAME is Building Relationships:

1. Click the `WEIGHT` value.
2. Enter the value `0.15`.
3. Press the key **Enter**.
7. In the row where `NAME` is `Customer Focus`:
 1. Click the `WEIGHT` value.
 2. Enter the value `0.15`.
 3. Press the key **Enter**.
8. Click the icon **Commit Changes**.
 This icon is a picture of a data drum with a green check mark in the lower right corner.
 Under the Data pane is the Data Editor Log pane.
9. Check the Data Editor Log pane for the message "Commit Successful".
10. Check the new data in the Data Pane.

See Also: ["About the UPDATE Statement"](#) on page 5-4

Tutorial: Deleting Rows from Tables with the Delete Selected Row(s) Tool

This tutorial shows how to use the Delete Selected Row(s) tool to delete a row from the `PERFORMANCE_PARTS` table (populated in ["Tutorial: Adding Rows to Tables with the Insert Row Tool"](#) on page 6-11).

To delete row from `PERFORMANCE_PARTS` using Delete Selected Row(s) tool:

1. On the Connections tab, expand `hr_conn`.
 Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Tables**.
 A list of tables appears.
3. Select `PERFORMANCE_PARTS`.
4. In the right frame, click the tab **Data**.
 The Data pane appears, showing the rows of the `PERFORMANCE_PARTS` table.
5. Click the row where `NAME` is `Results Orientation`.
6. Click the icon **Delete Selected Row(s)**.
7. Click the icon **Commit Changes**.
 The row is deleted.
 Under the Data pane is the Data Editor - Log pane.
8. Check the Data Editor Log pane for the message "Commit Successful".

Note: If you delete every row of a table, the empty table still exists. To delete a table, see ["Dropping Tables"](#) on page 6-16.

See Also: ["About the DELETE Statement"](#) on page 5-5

Managing Indexes

You can create indexes on one or more columns of a table to speed SQL statement execution on that table. When properly used, indexes are the primary means of reducing disk I/O.

When you define a primary key on a table, Oracle Database creates a Unique index on the primary key. For example, in ["Tutorial: Adding Constraints to Existing Tables"](#) on page 6-6, you added a Primary Key constraint to the EVALUATION_ID column of the EVALUATIONS table. Therefore, if you select the EVALUATIONS table in the SQL Developer navigation frame and click the Indexes tab, the Indexes pane shows a Unique index on the EVALUATION_ID column.

Topics:

- [Tutorial: Adding an Index with the Create Index Tool](#)
- [Tutorial: Changing an Index with the Edit Index Tool](#)
- [Tutorial: Dropping an Index](#)

See Also: For more information about indexes:

- *Oracle Database Concepts*
- *Oracle Database Advanced Application Developer's Guide*

Tutorial: Adding an Index with the Create Index Tool

To create an index, use either the SQL Developer tool Create Index or the DDL statement `CREATE INDEX`.

This tutorial shows how to use the Create Index tool to add an index to the EVALUATIONS table (created in ["Creating Tables with the CREATE TABLE Statement"](#) on page 6-4). The equivalent DDL statement is:

```
CREATE INDEX EVAL_JOB_IX
ON EVALUATIONS (JOB_ID ASC) NOPARALLEL;
```

To add an index to the EVALUATIONS table using the Create Index tool:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Tables**.
A list of tables appears, including EVALUATIONS.
3. Right-click **EVALUATIONS**.
A list of choices appears.
4. Select **Index**.
A list of choices appears.
5. Select **Create Index**.
The Create Index window opens.
6. For Schema, accept the default, **HR**.
7. For Name, type **EVAL_JOB_IX**.
8. Select the tab **Definition**.
The Definition pane shows the default values for index properties.

9. In the field labeled "Column Name or Expression:", type `JOB_ID`.
(For all other properties, accept the default values.)

10. Click **OK**.

Now the `EVALUATIONS` table has an index named `EVAL_JOB_IX` on the column `JOB_ID`.

See Also: *Oracle Database SQL Language Reference* for information about the `CREATE INDEX` statement

Tutorial: Changing an Index with the Edit Index Tool

To change an index, use either the SQL Developer tool Edit Index or the DDL statements `DROP INDEX` and `CREATE INDEX`.

This tutorial shows how to use the Edit Index tool to reverse the sort order of the index `EVAL_JOB_IX` (created in "[Tutorial: Adding an Index with the Create Index Tool](#)" on page 6-14). The equivalent DDL statements are:

```
DROP INDEX EVAL_JOB_ID;
```

```
CREATE INDEX EVAL_JOB_IX
ON EVALUATIONS (JOB_ID DESC) NOPARALLEL;
```

To reverse the sort order of the index `EVAL_JOB_IX` using the Edit Index tool:

1. On the Connections tab, expand **hr_conn**.
Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Indexes**.
A list of indexes appears, including `EVAL_JOB_IX`.
3. Right-click **EVAL_JOB_IX**.
A list of choices appears.
4. Click **Edit**.
A list of choices appears.
5. Click **Edit Index**.
The Edit Index window opens.
6. In the Edit Index window, change **Order** to `DESC`.
7. Click **OK**.

See Also: *Oracle Database SQL Language Reference* for information about the `ALTER INDEX` statement

Tutorial: Dropping an Index

To drop an index, use either the SQL Developer tool Drop or the DDL statement `DROP INDEX`.

This tutorial shows how to use the navigation frame and Drop tool to drop the index `EVAL_JOB_IX` (created in "[Tutorial: Adding an Index with the Create Index Tool](#)" on page 6-14). The equivalent DDL statement is:

```
DROP INDEX EVAL_JOB_ID;
```

To drop the index EVAL_JOB_IX:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Indexes**.
A list of indexes appears, including EVAL_JOB_IX.
3. Right-click **EVAL_JOB_IX**.
A list of choices appears.
4. Click **Drop**.
The Drop window opens.
5. Click **Apply**.
The Confirmation window opens.
6. Click **OK**.

See Also: *Oracle Database SQL Language Reference* for information about the DROP INDEX statement

Dropping Tables

To drop a table, use either the SQL Developer navigation frame and Drop tool, or the DDL statement DROP TABLE.

Caution: Do not drop any of the tables that you created in ["Creating Tables"](#) on page 6-3—you need them for later tutorials. If you want to practice dropping tables, create simple ones and then drop them.

To drop a table using the Drop tool:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Tables**.
A list of tables appears.
3. Right-click the name of the table to drop.
A list of choices appears.
4. Click **Table**.
A list of choices appears.
5. Click **Drop**.
The Drop window opens.
6. Click **Apply**.
The Confirmation window opens.
7. Click **OK**.

See Also: *Oracle Database SQL Language Reference* for information about the DROP TABLE statement

Creating and Managing Views

A view presents the output of a query as a table. In most places that you can use a table, you can use a view. Views are useful when you need frequent access to information that is stored in several different tables.

Topics:

- [Creating Views](#)
- [Tutorial: Changing Views with the Edit View and Rename Tools](#)
- [Dropping Views](#)

See Also:

- [Chapter 4, "Selecting Table Data,"](#) for information about queries
- *Oracle Database Concepts* for additional general information about views

Creating Views

To create views, use either the SQL Developer tool Create View or the DDL statement `CREATE VIEW`. This topic shows how to use both of these ways to create these views:

- `SALESFORCE`, which contains the names and salaries of the employees in the Sales department
- `EMP_LOCATIONS`, which contains the names and locations of all employees

These view are part of the sample application that the tutorials and examples in this document show how to develop and deploy.

Topics:

- [Tutorial: Creating a View with the Create View Tool](#)
- [Creating Views with the CREATE VIEW Statement](#)

See Also:

- *Oracle Database SQL Developer User's Guide* for more information about using SQL Developer to create a view
- *Oracle Database SQL Language Reference* for more information about the `CREATE VIEW` statement

Tutorial: Creating a View with the Create View Tool

This tutorial shows how to create the `SALESFORCE` view using the Create View tool.

To create the `SALESFORCE` view using the Create View tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Right-click **Views**.
A list of choices appears.
3. Click **New View**.
The Create View window opens, with default values for a new view.
4. For Schema, accept the default value, `HR`.

5. For Name, enter `SALESFORCE`.
6. Click the tab **SQL Query**.
The SQL Query pane appears.
7. In the SQL Query field:
 - After `SELECT`, type:

```
FIRST_NAME || ' ' || LAST_NAME "Name", SALARY*12 "Annual Salary"
```
 - After `FROM`, type:

```
EMPLOYEES WHERE DEPARTMENT_ID = 80
```
8. Click **Test Syntax**.
A message appears in the field SQL Parse Results.
9. If the message is not "No errors found in SQL", return to step 7 and correct the syntax errors in the query.
10. Click **OK**.
The view `SALESFORCE` is created. To see it, expand Views in the navigation frame.

See Also: *Oracle Database SQL Developer User's Guide* for more information about using SQL Developer to create views

Creating Views with the CREATE VIEW Statement

The `CREATE VIEW` statement in [Example 6-3](#) creates the `EMP_LOCATIONS` view, which joins four tables. (For information about joins, see [Section , "Selecting Data from Multiple Tables."](#))

Example 6-3 Creating the EMP_LOCATIONS View with CREATE VIEW

```
CREATE VIEW EMP_LOCATIONS AS
SELECT e.EMPLOYEE_ID,
       e.LAST_NAME || ' ' || e.FIRST_NAME NAME,
       d.DEPARTMENT_NAME DEPARTMENT,
       l.CITY CITY,
       c.COUNTRY_NAME COUNTRY
FROM EMPLOYEES e, DEPARTMENTS d, LOCATIONS l, COUNTRIES c
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID AND
      d.LOCATION_ID = l.LOCATION_ID AND
      l.COUNTRY_ID = c.COUNTRY_ID
ORDER BY LAST_NAME;
```

Result:

View created.

See Also: *Oracle Database SQL Language Reference* for information about the `CREATE VIEW` statement

Tutorial: Changing Views with the Edit View and Rename Tools

To change the query in a view, use either the SQL Developer tool Edit View or the DDL statement `CREATE VIEW` with the `OR REPLACE` clause. To change the name of a view, use either the Rename tool or the `RENAME` statement.

This tutorial shows how to use the Edit View tool to add the employees of the Marketing department to the SALESFORCE view (created in "[Tutorial: Creating a View with the Create View Tool](#)" on page 6-17) and the and Rename tool to change its name to SALES_MARKETING. The equivalent DDL statements are:

```
CREATE OR REPLACE VIEW SALESFORCE AS
  SELECT FIRST_NAME || ' ' || LAST_NAME "Name",
         SALARY*12 "Annual Salary"
  FROM EMPLOYEES
  WHERE DEPARTMENT_ID = 80 OR DEPARTMENT_ID = 20;

RENAME SALESFORCE to SALES_MARKETING;
```

To change the SALESFORCE view using the Edit View and Rename tools:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Views**.
A list of views appears.
3. Right-click **SALESFORCE**.
A list of choices appears.
4. Select **Edit**.
The Edit View window opens. Its SQL Query field contains the query to be changed.
5. Add this to the end of the query:
`OR DEPARTMENT_ID = 20`
6. Click **Test Syntax**.
A message appears in the field SQL Parse Results.
7. If the message is not "No errors found in SQL", return to step 5 and correct the syntax errors in the query.
8. Click **OK**.
The employees of the Marketing department are added to the SALESFORCE view. Now change the name of the view to SALES_MARKETING.
9. Right-click **SALESFORCE**.
A list of choices appears.
10. Select **Rename**.
The Rename window opens. It has a New View Name field.
11. In the New View Name field, type `SALES_MARKETING`.
12. Click **Apply**.
The Confirmation window opens.
13. Click **OK**.

See Also:

- *Oracle Database SQL Language Reference* for information about the `CREATE VIEW` statement with the `OR REPLACE` clause
- *Oracle Database SQL Language Reference* for information about the `RENAME` statement

Dropping Views

To drop a view, use either the SQL Developer navigation frame and Drop tool or the DDL statement `DROP VIEW`.

This tutorial shows how to use the navigation frame and Drop tool to drop the view `SALES_MARKETING` (changed in "[Tutorial: Changing Views with the Edit View and Rename Tools](#)" on page 6-18). The equivalent DDL statement is:

```
DROP VIEW SALES_MARKETING;
```

To drop the view `SALES_MARKETING` using the Drop tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Views**.
A list of views appears.
3. Right-click `SALES_MARKETING`.
A list of choices appears.
4. Click **Drop**.
The Drop window opens.
5. Click **Apply**.
The Confirmation window opens.
6. Click **OK**.

See Also:

- *Oracle Database SQL Language Reference* for information about the `DROP VIEW` statement

Creating and Managing Sequences

Sequences are schema objects that generate unique sequential values, which are very useful when you need unique primary keys. The `HR` schema has three sequences: `DEPARTMENTS_SEQ`, `EMPLOYEES_SEQ`, and `LOCATIONS_SEQ`.

Sequences are used through the pseudocolumns `CURRVAL` and `NEXTVAL`, which return the current and next values of the sequence, respectively. After creating a sequence, you must initialize it by using `NEXTVAL` to get its first value. Only after the sequence is initialized does `CURRVAL` return its current value.

Tip: When you plan to use a sequence to populate the primary key of a table, give the sequence a name that reflects this purpose. (This topic uses the naming convention `table_name_SEQ`.)

Topics:

- [Tutorial: Creating a Sequence](#)
- [Dropping Sequences](#)

See Also:

- *Oracle Database Concepts* for information about the sequence generator
- *Oracle Database SQL Language Reference* for more information about the CURRVAL and NEXTVAL pseudocolumns
- ["Editing Installation Script Files that Create Sequences"](#) on page 10-5

Tutorial: Creating a Sequence

To create a sequence, use either the SQL Developer tool Create Sequence or the DDL statement `CREATE SEQUENCE`.

This tutorial shows how to use the Create Database Sequence tool to create a sequence to use to generate primary keys for the `EVALUATIONS` table (created in ["Creating Tables with the CREATE TABLE Statement"](#) on page 6-4). The equivalent DDL statement is:

```
CREATE SEQUENCE EVALUATIONS_SEQ
INCREMENT BY 1
START WITH 1 ORDER;
```

This sequence is part of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create `EVALUATIONS_SEQ` using the Create Database Sequence tool:

1. On the Connections tab, expand **hr_conn**.
Under the `hr_conn` icon, a list of schema object types appears.
2. Right-click **Sequences**.
A list of choices appears.
3. Click **New Sequence**.
The Create Database Sequence window opens. The field Schema has the value `HR`, and the field Name has the default value, `SEQUENCE1`.
4. In the Name field, type `EVALUATIONS_SEQ` over the default value.
5. Click the tab **Properties**.
The Properties pane appears.
6. In the field Increment, type 1.
7. In the field Start with, type 1.
8. Deselect the check box **Cycle**.
9. Select the check box **Order**.
10. Click **OK**.

The sequence `EVALUATIONS_SEQ` is created. To see it, expand Sequences in the navigation frame.

See Also:

- *Oracle Database SQL Developer User's Guide* for more information about using SQL Developer to create a sequence
- *Oracle Database SQL Language Reference* for information about the `CREATE SEQUENCE` statement
- ["Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted"](#) on page 8-4 to learn how to create a trigger that inserts the primary keys created by `evaluations_seq` into the `EVALUATIONS` table

Dropping Sequences

To drop a sequence, use either the SQL Developer navigation frame and Drop tool, or the DDL statement `DROP SEQUENCE`.

Caution: Do not drop the sequence that you created in ["Tutorial: Creating a Sequence"](#) on page 6-21—you need it for later tutorials. If you want to practice dropping sequences, create new ones and then drop them.

To drop a sequence using the Drop tool:

1. On the Connections tab, expand **hr_conn**.
Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Sequences**.
A list of sequences appears.
3. Right-click the name of the sequence to drop.
A list of choices appears.
4. Click **Drop**.
The Drop window opens.
5. Click **Apply**.
The Confirmation window opens.
6. Click **OK**.

See Also: *Oracle Database SQL Language Reference* for information about the `DROP SEQUENCE` statement

Creating and Managing Synonyms

A synonym is an alias for another schema object. Some reasons to use synonyms are security (for example, to hide the owner and location of an object) and convenience. Examples of convenience are:

- Using a short synonym, such as `SALES`, for a long object name, such as `ACME_CO.SALES_DATA`
- Using a synonym for a renamed object, instead of changing that object name throughout the applications that use it

For example, if your application uses a table named `DEPARTMENTS`, and its name changes to `DIVISIONS`, you can create a `DEPARTMENTS` synonym for that table and continue to reference it by its original name.

Topics:

- [Creating Synonyms](#)
- [Dropping Synonyms](#)

See Also:

- *Oracle Database Concepts* for additional general information about synonyms

Creating Synonyms

To create a synonym, use either the SQL Developer tool Create Database Synonym or the DDL statement `CREATE SYNONYM`.

This tutorial shows how to use the Create Database Synonym tool to create the synonym `EMP` for the `EMPLOYEES` table. The equivalent DDL statement is:

```
CREATE SYNONYM EMP FOR EMPLOYEES;
```

This synonym is part of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create a synonym using the Create Database Synonym tool:

1. On the Connections tab, expand **hr_conn**.

Under the `hr_conn` icon, a list of schema object types appears.

2. Right-click **Synonyms**.

A list of choices appears.

3. Click **New Synonym**.

The Create Database Synonym window opens. The check box **Public** is deselected, the field **Schema** has the value `HR`, and the field **Name** has the default value `SYNONYM1`.

4. In the **Name** field, type `EMP` over the default value.

5. Click the tab **Properties**.

The **Properties** pane appears. The **Referenced Schema** field has the value `HR`, the option **Object based** is deselected, and the option **Name based** is selected.

6. Select **Object Based**.

The option **Name based** is now deselected.

7. In the field next to the **Object based** option, select `EMPLOYEES` from the drop-down list.

Object based means that the synonym refers to a specific schema object; in this case, the table `EMPLOYEES`.

8. Click **OK**.

The synonym `EMP` is created. To see it, expand **Synonyms** in the navigation frame. You can now use `EMP` instead of `EMPLOYEES`.

See Also: *Oracle Database SQL Language Reference* for information about the `CREATE SYNONYM` statement

Dropping Synonyms

To drop a synonym, use either the SQL Developer navigation frame and Drop tool, or the DDL statement `DROP SYNONYM`.

Caution: Do not drop the synonym that you created in "[Creating Synonyms](#)" on page 6-23—you need it for later tutorials. If you want to practice dropping synonyms, create new ones and then drop them.

To drop a synonym using the Drop tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Expand **Synonyms**.
A list of synonyms appears.
3. Right-click the name of the synonym to drop.
A list of choices appears.
4. Click **Drop**.
The Drop window opens.
5. Click **Apply**.
The Confirmation window opens.
6. Click **OK**.

See Also: *Oracle Database SQL Language Reference* for information about the `DROP SYNONYM` statement

Developing Stored Subprograms and Packages

This chapter contains the following topics:

- [About Stored Subprograms](#)
- [About Packages](#)
- [About PL/SQL Identifiers](#)
- [About PL/SQL Data Types](#)
- [Creating and Managing Standalone Stored Subprograms](#)
- [Creating and Managing Packages](#)
- [Declaring and Assigning Values to Variables and Constants](#)
- [Controlling Program Flow](#)
- [Using Records and Cursors](#)
- [Using Associative Arrays](#)
- [Handling Exceptions \(Run-Time Errors\)](#)

Tip: If you have problems creating or running PL/SQL code, check the Oracle Database trace files. The `USER_DUMP_DEST` initialization parameter specifies the current location of the trace files. You can find the value of this parameter by issuing `SHOW PARAMETER USER_DUMP_DEST` in the SQL Worksheet of SQL Developer or in SQL*Plus. For more information about trace files, see *Oracle Database Performance Tuning Guide*.

About Stored Subprograms

A **subprogram** is a PL/SQL unit that consists of SQL and PL/SQL statements that solve a specific problem or perform a set of related tasks. A subprogram can have parameters, whose values are supplied by the invoker. A subprogram can be either a procedure or a function. Typically, you use a procedure to perform an action and a function to compute and return a value.

A **stored subprogram** is a subprogram that is stored in the database. Because they are stored in the database, stored programs can be used as building blocks for many different database applications. (A subprogram that is declared within another subprogram, or within an anonymous block, is called a **nested subprogram** or **local subprogram**. It cannot be invoked from outside the subprogram or block in which it is declared. An **anonymous block** is a block that is not stored in the database.)

There are two kinds of stored subprograms:

- **Standalone stored subprogram**, which is created at schema level
- **Package subprogram**, which is created inside a package

Standalone stored subprograms are useful for testing pieces of program logic, but when you are sure that they work as intended, Oracle recommends that you put them into packages.

See Also:

- *Oracle Database Concepts* for general information about stored subprograms
- *Oracle Database PL/SQL Language Reference* for complete information about PL/SQL subprograms

About Packages

A **package** is a PL/SQL unit that consists of related subprograms and the explicit cursors and variables that they use.

Oracle recommends that you put your subprograms into packages. Some of the reasons are:

- Packages allow you to hide implementation details from client programs.
Hiding implementation details from client programs is a widely accepted best practice. Many Oracle customers follow this practice strictly, allowing client programs to access the database only by invoking PL/SQL subprograms. Some customers allow client programs to use `SELECT` statements to retrieve information from database tables, but require them to invoke PL/SQL subprograms for all business functions that change the database.
- Package subprograms must be qualified with package names when invoked, which ensures that their names will always work.

For example, suppose that you developed a schema-level procedure named `CONTINUE` before Oracle Database 11g Release 1 (11.1). Release 11.1 introduced the `CONTINUE` statement. Therefore, if you ported your code to 11.1, it would no longer compile. However, if you had developed your procedure inside a package, your code would refer to the procedure as `package_name.CONTINUE`, so the code would still compile.

- Package subprograms can send and receive records and collections.

Standalone stored subprograms can send and receive only scalar parameters—single values with no internal components, such as `VARCHAR2`, `NUMBER`, and `DATE`.

Note: Oracle Database supplies many PL/SQL packages to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures. For information about these packages, see *Oracle Database PL/SQL Packages and Types Reference*.

See Also:

- *Oracle Database Concepts* for general information about packages
- *Oracle Database PL/SQL Language Reference* for more reasons to use packages
- *Oracle Database PL/SQL Language Reference* for complete information about PL/SQL packages
- *Oracle Database PL/SQL Packages and Types Reference* for complete information about the PL/SQL packages that Oracle provides

About PL/SQL Identifiers

Every PL/SQL subprogram, package, parameter, variable, constant, exception, and explicit cursor has a name, which is a PL/SQL identifier.

The minimum length of an identifier is one character; the maximum length is 30 characters. The first character must be a letter, but each later character can be either a letter, numeral, dollar sign (\$), underscore (_), or number sign (#). For example, these are acceptable identifiers:

```
x
t2
phone#
credit_limit
LastName
oracle$number
money$$$tree
SN##
try_again_
```

PL/SQL is not case-sensitive for identifiers. For example, PL/SQL considers these to be the same:

```
lastname
LastName
LASTNAME
```

You cannot use a PL/SQL reserved word as an identifier. You can use a PL/SQL keyword as an identifier, but it is not recommended. For lists of PL/SQL reserved words and keywords, see *Oracle Database PL/SQL Language Reference*.

Tip: Use meaningful names for identifiers, and follow a naming convention. For example, start each constant name with `con_`, each variable name with `var_`, and so on.

See Also:

- *Oracle Database PL/SQL Language Reference* for additional general information about PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for additional information about PL/SQL naming conventions
- *Oracle Database PL/SQL Language Reference* for information about the scope and visibility of PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for information how to collect data on PL/SQL identifiers
- *Oracle Database PL/SQL Language Reference* for information about how PL/SQL resolves identifier names

About PL/SQL Data Types

Every PL/SQL constant, variable, subprogram parameter, and function return value has a data type that determines its storage format, constraints, valid range of values, and operations that can be performed on it.

A PL/SQL data type is either a SQL data type (such as `VARCHAR2`, `NUMBER`, and `DATE`) or a PL/SQL-only data type. The latter include `BOOLEAN`, `RECORD`, `REF CURSOR`, and many predefined subtypes. PL/SQL also lets you define your own subtypes.

A **subtype** is a subset of another data type, which is called its **base type**. A subtype has the same valid operations as its base type, but only a subset of its valid values. Subtypes can increase reliability, provide compatibility with ANSI/ISO types, and improve readability by indicating the intended use of constants and variables.

The predefined numeric subtype `PLS_INTEGER` is especially useful, because its operations use hardware arithmetic, rather than the library arithmetic that its base type uses.

You cannot use PL/SQL-only data types at schema level (that is, in tables or standalone stored subprograms). Therefore, to use them in a stored subprogram, you must put the subprogram in a package.

See Also:

- *Oracle Database PL/SQL Language Reference* for general information about PL/SQL data types
- *Oracle Database PL/SQL Language Reference* for information about the `PLS_INTEGER` data type

Creating and Managing Standalone Stored Subprograms

Topics:

- [About Subprogram Structure](#)
- [Tutorial: Creating a Standalone Stored Procedure](#)
- [Tutorial: Creating a Standalone Stored Function](#)
- [Changing Standalone Stored Subprograms](#)
- [Tutorial: Testing a Standalone Stored Function](#)

■ Dropping Standalone Stored Subprograms

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user HR from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6.

About Subprogram Structure

A subprogram follows PL/SQL block structure; that is, it has:

- **Declarative part** (optional)
The declarative part contains declarations of types, constants, variables, exceptions, explicit cursors, and nested subprograms. These items are local to the subprogram and cease to exist when the subprogram completes execution.
- **Executable part** (required)
The executable part contains statements that assign values, control execution, and manipulate data.
- **Exception-handling part** (optional)
The exception-handling part contains code that handles exceptions (run-time errors).

Comments can appear anywhere in PL/SQL code. The PL/SQL compiler ignores them. Adding comments to your program promotes readability and aids understanding. A **single-line comment** starts with a double hyphen (--) and extends to the end of the line. A **multiline comment** starts with a slash and asterisk (/*) and ends with an asterisk and a slash (*/).

The structure of a procedure is:

```
PROCEDURE name [ ( parameter_list ) ]
{ IS | AS }
  [ declarative_part ]
BEGIN -- executable part begins
  statement; [ statement; ]...
[ EXCEPTION -- executable part ends, exception-handling part begins]
  exception_handler; [ exception_handler; ]... ]
END; /* exception-handling part ends if it exists;
      otherwise, executable part ends */
```

The structure of a function is like that of a procedure, except that it includes a RETURN clause and at least one RETURN statement (and some optional clauses that are beyond the scope of this document):

```
FUNCTION name [ ( parameter_list ) ] RETURN data_type [ clauses ]
{ IS | AS }
  [ declarative_part ]
BEGIN -- executable part begins
  -- at least one statement must be a RETURN statement
  statement; [ statement; ]...
[ EXCEPTION -- executable part ends, exception-handling part begins]
  exception_handler; [ exception_handler; ]... ]
END; /* exception-handling part ends if it exists;
      otherwise, executable part ends */
```

The code that begins with `PROCEDURE` or `FUNCTION` and ends before `IS` or `AS` is the **subprogram signature**. The declarative, executable, and exception-handling parts comprise the **subprogram body**. The syntax of *exception-handler* is in ["About Exceptions and Exception Handlers"](#) on page 7-48.

See Also: *Oracle Database PL/SQL Language Reference* for more information about subprogram parts

Tutorial: Creating a Standalone Stored Procedure

To create a standalone stored procedure, use either the SQL Developer tool Create PL/SQL Procedure or the DDL statement `CREATE PROCEDURE`.

This tutorial shows how to use the Create PL/SQL Procedure tool to create a standalone stored procedure named `ADD_EVALUATION` that adds a row to the `EVALUATIONS` table (created in ["Creating Tables with the CREATE TABLE Statement"](#) on page 6-4).

To create a standalone stored procedure using Create PL/SQL Procedure tool:

1. On the Connections tab, expand `hr_conn`.
Under the `hr_conn` icon, a list of schema object types appears.
2. Right-click **Procedures**.
A list of choices appears.
3. Click **New Procedure**.
The Create PL/SQL Procedure window opens.
4. For Schema, accept the default value, `HR`.
5. For Name, change `PROCEDURE1` to `ADD_EVALUATION`.
6. Click the icon **Add Column**.
A row appears under the column headings. Its fields have these default values: Name, `param1`; Type, `VARCHAR2`; Mode, `IN`; Default Value, empty.
7. For Name, change `param1` to `evaluation_id`.
8. For Type, select `NUMBER` from the drop-down list.
9. For Mode, accept the default value, `IN`.
10. Leave Default Value empty.
11. Add a second parameter by repeating steps 6 through 10 with the Name `employee_id` and the Type `NUMBER`.
12. Add a third parameter by repeating steps 6 through 10 with the Name `evaluation_date` and the Type `DATE`.
13. Add a fourth parameter by repeating steps 6 through 10 with the Name `job_id` and the Type `VARCHAR2`.
14. Add a fifth parameter by repeating steps 6 through 10 with the Name `manager_id` and the Type `NUMBER`.
15. Add a sixth parameter by repeating steps 6 through 10 with the Name `department_id` and the Type `NUMBER`.
16. Add a seventh parameter by repeating steps 6 through 10 with the Name `total_score` and the Type `NUMBER`.

17. Click OK.

The ADD_EVALUATION pane opens, showing the CREATE PROCEDURE statement that created the procedure:

```
CREATE OR REPLACE
PROCEDURE ADD_EVALUATION
( evaluation_id IN NUMBER
, employee_id IN NUMBER
, evaluation_date IN DATE
, job_id IN VARCHAR2
, manager_id IN NUMBER
, department_id IN NUMBER
, total_score IN NUMBER
) AS
BEGIN
    NULL;
END ADD_EVALUATION;
```

Because the only statement in the execution part of the procedure is NULL, the procedure does nothing.

18. Replace NULL with this statement:

```
INSERT INTO EVALUATIONS (
    evaluation_id,
    employee_id,
    evaluation_date,
    job_id,
    manager_id,
    department_id,
    total_score
)
VALUES (
    ADD_EVALUATION.evaluation_id,
    ADD_EVALUATION.employee_id,
    ADD_EVALUATION.evaluation_date,
    ADD_EVALUATION.job_id,
    ADD_EVALUATION.manager_id,
    ADD_EVALUATION.department_id,
    ADD_EVALUATION.total_score
);
```

(Qualifying the parameter names with the procedure name ensures that they are not confused with the columns that have the same names.)

The title of the ADD_EVALUATION pane is in italic font, indicating that the procedure is not yet saved in the database.

19. From the File menu, select Save.

Oracle Database compiles the procedure and saves it. The title of the ADD_EVALUATION pane is no longer in italic font.

See Also:

- *Oracle Database SQL Developer User's Guide* for another example of using SQL Developer to create a standalone stored procedure
- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the `CREATE PROCEDURE` statement
- *Oracle Database PL/SQL Language Reference* for information about the `CREATE PROCEDURE` statement

Tutorial: Creating a Standalone Stored Function

To create a standalone stored function, use either the SQL Developer tool **Create PL/SQL Function** or the DDL statement `CREATE FUNCTION`.

This tutorial shows how to use the **Create PL/SQL Function** tool to create a standalone stored function named `calculate_score` that has three parameters and returns a value of type `NUMBER`.

To create a standalone stored function using Create PL/SQL Function tool:

1. On the **Connections** tab, expand **hr_conn**.
Under the **hr_conn** icon, a list of schema object types appears.
2. Right-click **Functions**.
A list of choices appears.
3. Click **New Function**.
The **Create PL/SQL Function** window opens. It looks like the **Create PL/SQL Procedure** window (see ["Tutorial: Creating a Standalone Stored Procedure"](#) on page 7-6) except that its **Parameters** pane has a row for the value that the function returns. In that row, the value of **Name** is `<Return>` and the default value of **Type** is `VARCHAR2`.
4. For **Schema**, accept the default value, **HR**.
5. For **Name**, change `FUNCTION1` to `calculate_score`.
6. In the **Parameters** pane, in the **Type** field of the only row, select `NUMBER` from the drop-down list.
7. Click the icon **Add Column**.
A row appears under the column headings. Its fields have these default values: **Name**, `param1`; **Type**, `VARCHAR2`; **Mode**, `IN`; **Default Value**, empty.
8. For **Name**, change `param1` to `cat`.
9. For **Type**, accept the default, `VARCHAR2`.
10. For **Mode**, accept the default value, `IN`.
11. Leave **Default Value** empty.
12. Add a second parameter by repeating steps 7 through 11 with the **Name** `score` and the **Type** `NUMBER`.
13. Add a third parameter by repeating steps 7 through 11 with the **Name** `weight` and the **Type** `NUMBER`.
14. Click **OK**.

The `calculate_score` pane opens, showing the `CREATE FUNCTION` statement that created the function:

```
CREATE OR REPLACE
FUNCTION calculate_score
( cat IN VARCHAR2
, score IN NUMBER
, weight IN NUMBER
) RETURN NUMBER AS
BEGIN
    RETURN NULL;
END calculate_score;
```

Because the only statement in the execution part of the function is `RETURN NULL`, the function does nothing.

15. Replace `NULL` with `score * weight`.

The title of the `calculate_score` pane is in italic font, indicating that the function is not yet saved in the database.

16. Select **Save** from the File menu.

Oracle Database compiles the function and saves it. The title of the `calculate_score` pane is no longer in italic font.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the `CREATE FUNCTION` statement
- *Oracle Database PL/SQL Language Reference* for information about the `CREATE FUNCTION` statement

Changing Standalone Stored Subprograms

To change a standalone stored subprogram, use either the SQL Developer tool **Edit** or the DDL statement `ALTER PROCEDURE` or `ALTER FUNCTION`.

To change a standalone stored subprogram using the **Edit** tool:

1. On the **Connections** tab, expand **hr_conn**.

Under the **hr_conn** icon, a list of schema object types appears.

2. Expand either **Functions** or **Procedures**.

A list of functions or procedures appears.

3. Click the function or procedure to change.

To the right of the **Connections** pane, a frame appears. Its top tab has the name of the subprogram to change. Under the top tab are subtabs.

4. Click the subtab **Code**.

The **Code** pane appears, showing the code that created the subprogram to change.

5. Click the icon **Edit**.

Another pane appears, also with the name of the subprogram to change.

6. In the pane, change the code.

The title of the pane changes to italic font, indicating that the change is not yet saved in the database.

7. Select **Save** from the File menu.

Oracle Database compiles the subprogram and saves it. The title of the pane is no longer in italic font.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the ALTER PROCEDURE and ALTER FUNCTION statements
- *Oracle Database PL/SQL Language Reference* for information about the ALTER PROCEDURE statement
- *Oracle Database PL/SQL Language Reference* for information about the ALTER FUNCTION statement

Tutorial: Testing a Standalone Stored Function

This tutorial shows how to use the SQL Developer tool Run to test the standalone stored function `calculate_score` (created in ["Tutorial: Creating a Standalone Stored Function"](#) on page 7-8).

To test the `calculate_score` function using the Run tool:

1. On the Connections tab, expand `hr_conn`.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Functions**.

A list of functions appears.

3. Right-click **calculate_score**.

A list of choices appears.

4. Click **Run**.

The Run PL/SQL window opens. Its PL/SQL Block frame includes this code:

```
v_Return := calculate_score (  
    CAT => CAT,  
    SCORE => SCORE,  
    WEIGHT => WEIGHT  
);
```

5. Change the values of `SCORE` and `WEIGHT` to 8 and 0.2, respectively:

```
v_Return := calculate_score (  
    CAT => CAT,  
    SCORE => 8,  
    WEIGHT => 0.2  
);
```

6. Click **OK**.

The Running - Log window opens, showing this result:

```
Connecting to the database hr_conn.  
v_Return = 1.6  
Process exited.  
Disconnecting from the database hr_conn.
```

See Also: *Oracle Database SQL Developer User's Guide* for information about using SQL Developer to run and debug procedures and functions

Dropping Standalone Stored Subprograms

To drop a standalone stored subprogram, use either the SQL Developer navigation frame and Drop tool, or the DDL statement `DROP PROCEDURE` or `DROP FUNCTION`.

To drop a standalone stored subprogram using the Drop tool:

1. On the Connections tab, expand **hr_conn**.
Under the **hr_conn** icon, a list of schema object types appears.
2. Expand either **Functions** or **Procedures**.
A list of functions or procedures appears.
3. Right-click the name of the function or procedure to drop.
A list of choices appears.
4. Click **Drop**.
The Drop window opens.
5. Click **Apply**.
The Confirmation window opens.
6. Click **OK**.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the `DROP PROCEDURE` and `DROP FUNCTION` statements
- *Oracle Database SQL Language Reference* for information about the `DROP PROCEDURE` statement
- *Oracle Database SQL Language Reference* for information about the `DROP FUNCTION` statement

Creating and Managing Packages

Topics:

- [About Package Structure](#)
- [Tutorial: Creating a Package Specification](#)
- [Tutorial: Changing a Package Specification](#)
- [Tutorial: Creating a Package Body](#)
- [Dropping a Package](#)

See Also: ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16, which shows how to change a package body

About Package Structure

A package always has a specification, and it usually has a body.

The **package specification** defines the package, declaring the types, variables, constants, exceptions, explicit cursors, and subprograms that can be referenced from outside the package. A package specification is an **application program interface (API)**: It has all the information that client programs need to invoke its subprograms, but no information about their implementation.

The **package body** defines the queries for the explicit cursors, and the code for the subprograms, that are declared in the package specification (therefore, a package with neither explicit cursors nor subprograms does not need a body). The package body can also define **local subprograms**, which are not declared in the specification and can be invoked only by other subprograms in the package. Package body contents are hidden from client programs. You can change the package body without invalidating the applications that call the package.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about the package specification
- *Oracle Database PL/SQL Language Reference* for more information about the package body

Tutorial: Creating a Package Specification

To create a package specification, use either the SQL Developer tool Create PL/SQL Package or the DDL statement `CREATE PACKAGE`.

This tutorial shows how to use the Create PL/SQL Package tool to create a specification for a package named `EMP_EVAL`.

This package specification is the API for the sample application that the tutorials and examples in this document show how to develop and deploy.

To create a package specification using Create PL/SQL Package tool:

1. On the Connections tab, expand `hr_conn`.

Under the `hr_conn` icon, a list of schema object types appears.

2. Right-click **Packages**.

A list of choices appears.

3. Click **New Package**.

The Create PL/SQL Package window opens. The field Schema has the value `HR`, the field Name has the default value `PACKAGE1`, and the check box Add New Source In Lowercase is deselected.

4. For Schema, accept the default value, `HR`.
5. For Name, change `PACKAGE1` to `EMP_EVAL`.
6. Click **OK**.

The `EMP_EVAL` pane opens, showing the `CREATE PACKAGE` statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

    /* TODO enter package declarations (types, exceptions, methods etc) here */
```

```
END emp_eval;
```

The title of the pane is in italic font, which indicates that the package is not saved to the database.

7. (Optional) In the CREATE PACKAGE statement, replace the comment with declarations.

If you do not do this step now, you can do it later, as shown in "[Tutorial: Changing a Package Specification](#)" on page 7-13.

8. From the File menu, select **Save**.

Oracle Database compiles the package and saves it. The title of the EMP_EVAL pane is no longer in italic font.

See Also: *Oracle Database PL/SQL Language Reference* for information about the CREATE PACKAGE statement (for the package specification)

Tutorial: Changing a Package Specification

To change a package specification, use either the SQL Developer tool Edit or the DDL statement CREATE PACKAGE with the OR REPLACE clause.

This tutorial shows how to use the Edit tool to change the specification for the EMP_EVAL package (created in "[Tutorial: Creating a Package Specification](#)" on page 7-12). Specifically, the tutorial shows how to add declarations for a procedure, eval_department, and a function, calculate_score.

To change EMP_EVAL package specification using the Edit tool:

1. On the Connections tab, expand **hr_conn**.

Under the hr_conn icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Right-click **EMP_EVAL**.

A list of choices appears.

4. Click **Edit**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

    /* TODO enter package declarations (types, exceptions, methods etc) here */

END emp_eval;
```

The title of the pane is not in italic font, which indicates that the package is saved in the database.

5. In the EMP_EVAL pane, replace the comment with this code:

```
PROCEDURE eval_department ( dept_id IN NUMBER );

FUNCTION calculate_score ( evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
RETURN NUMBER;
```

A new `EMP_EVAL` pane opens, showing the changed `CREATE PACKAGE` statement. The title of the pane is in italic font, which indicates that the changes have not been saved to the database.

6. Click the icon **Compile**.

The changed package specification compiles and is saved to the database. The title of the `EMP_EVAL` pane is no longer in italic font.

See Also: *Oracle Database PL/SQL Language Reference* for information about the `CREATE PACKAGE` statement with the `OR REPLACE` clause

Tutorial: Creating a Package Body

To create a package body, use either the SQL Developer tool Create Body or the DDL statement `CREATE PACKAGE BODY`.

This tutorial shows how to use the Create Body tool to create a body for the `EMP_EVAL` package (created in "[Tutorial: Creating a Package Specification](#)" on page 7-12 and changed in "[Tutorial: Changing a Package Specification](#)" on page 7-13).

This package body will contain the implementation details of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create a body for the package `EMP_EVAL` using the Create Body tool:

1. On the Connections tab, expand `hr_conn`.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Right-click `EMP_EVAL`.

A list of choices appears.

4. Click **Create Body**.

The `EMP_EVAL` Body pane appears, showing the automatically generated code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY emp_eval AS

    PROCEDURE eval_department(dept_id IN NUMBER) AS
    BEGIN
        /* TODO implementation required */
        NULL;
    END eval_department;

    FUNCTION calculate_score ( evaluation_id IN NUMBER
                              , performance_id IN NUMBER)
                              RETURN NUMBER AS
    BEGIN
        /* TODO implementation required */
        RETURN NULL;
    END calculate_score;

END emp_eval;
```

The title of the pane is in italic font, which indicates that the code is not saved in the database.

5. (Optional) In the `CREATE PACKAGE BODY` statement:

- Replace the comments with executable statements.
- (Optional) In the executable part of the procedure, either delete `NULL` or replace it with an executable statement.
- (Optional) In the executable part of the function, either replace `NULL` with another expression.

If you do not do this step now, you can do it later, as shown in "[Tutorial: Declaring Variables and Constants in a Subprogram](#)" on page 7-16.

6. Click the icon **Compile**.

The changed package body compiles and is saved to the database. The title of the `EMP_EVAL` Body pane is no longer in italic font.

See Also: *Oracle Database PL/SQL Language Reference* for information about the `CREATE PACKAGE BODY` statement (for the package body)

Dropping a Package

To drop a package (specification and body), use either the SQL Developer navigation frame and Drop tool, or the DDL statement `DROP PACKAGE`.

To drop a package using the Drop tool:

1. On the Connections tab, expand the `hr_conn` information by clicking the plus sign (+) to the left of the `hr_conn` icon.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Right-click the name of the package to drop.

A list of choices appears.

4. Click **Drop Package**.

The Drop window opens.

5. Click **Apply**.

The Confirmation window opens.

6. Click **OK**.

See Also: *Oracle Database PL/SQL Language Reference* for information about the `DROP PACKAGE` statement

Declaring and Assigning Values to Variables and Constants

One significant advantage that PL/SQL has over SQL is that PL/SQL lets you declare and use variables and constants.

A variable or constant declared in a package specification can be used by any program that has access to the package. A variable or constant declared in a package body or subprogram is local to that package or subprogram.

A **variable** holds a value of a particular data type. Your program can change the value at run time. A **constant** holds a value that cannot be changed.

A variable or constant can have any PL/SQL data type. When declaring a variable, you can assign it an initial value; if you do not, its initial value is `NULL`. When declaring a constant, you must assign it an initial value. To assign an initial value to a variable or constant, use the assignment operator (`:=`).

Tip: Declare all values that do not change as constants. This practice optimizes your compiled code and makes your source code easier to maintain.

Topics:

- [Tutorial: Declaring Variables and Constants in a Subprogram](#)
- [Ensuring that Variables, Constants, and Parameters Have Correct Data Types](#)
- [Tutorial: Changing Declarations to Use the %TYPE Attribute](#)
- [Assigning Values to Variables](#)

See Also: *Oracle Database PL/SQL Language Reference* for general information about variables and constants

Tutorial: Declaring Variables and Constants in a Subprogram

This tutorial shows how to use the SQL Developer tool Edit to declare variables and constants in the `EMP_EVAL.calculate_score` function (specified in "[Tutorial: Creating a Package Specification](#)" on page 7-12). (This tutorial is also an example of changing a package body.)

To declare variables and constants in `calculate_score` function:

1. On the Connections tab, expand the `hr_conn` information by clicking the plus sign (+) to the left of the `hr_conn` icon.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Expand **EMP_EVAL**.

A list appears.

4. Right-click **EMP_EVAL Body**.

A list of choices appears.

5. Click **Edit**.

The `EMP_EVAL Body` pane appears, showing the code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY emp_eval AS

    PROCEDURE eval_department ( dept_id IN NUMBER ) AS

    BEGIN
        /* TODO implementation required */
        NULL;
    END eval_department;
```

```

FUNCTION calculate_score ( evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
RETURN NUMBER AS

BEGIN
    /* TODO implementation required */
    RETURN NULL;
END calculate_score;

END emp_eval;

```

6. Between RETURN NUMBER AS and BEGIN, add these variable and constant declarations:

```

n_score      NUMBER(1,0);           -- variable
n_weight     NUMBER;                -- variable
max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1

```

7. From the File menu, select **Save**.

Oracle Database saves the changed package body.

See Also:

- *Oracle Database PL/SQL Language Reference* for general information about declaring variables and constants
- ["Assigning Values to Variables with the Assignment Operator"](#) on page 7-20

Ensuring that Variables, Constants, and Parameters Have Correct Data Types

After ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16, the code for the calculate_score function, in the body of the package EMP_EVAL, is:

```

FUNCTION calculate_score ( evaluation_id IN NUMBER
                        , performance_id IN NUMBER )
RETURN NUMBER AS

n_score      NUMBER(1,0);           -- variable
n_weight     NUMBER;                -- variable
max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1
BEGIN
    /* TODO implementation required */
    RETURN NULL;
END calculate_score;

```

The variables, constants, and parameters of the function represent values from the tables SCORES (created in ["Creating Tables with the CREATE TABLE Statement"](#) on page 6-4) and PERFORMANCE_PARTS (created in ["Tutorial: Creating a Table with the Create Table Tool"](#) on page 6-3):

- Variable n_score will hold a value from the SCORE column of the SCORES table, and constant max_score will be compared to such values.
- Variable n_weight will hold a value from the WEIGHT column of the PERFORMANCE_PARTS table, and constant max_weight will be compared to such values.
- Parameter evaluation_id will hold a value from the EVALUATION_ID column of the SCORES table.

- Parameter `performance_id` will hold a value from the `PERFORMANCE_ID` column of the `SCORES` table.

Therefore, each variable, constant, and parameter has the same data type as its corresponding column.

If the data types of the columns change, you want the data types of the variables, constants, and parameters to change to the same data types; otherwise, the `calculate_score` function will be invalidated.

To ensure that the data types of the variables, constants, and parameters will always match those of the columns, declare them with the `%TYPE` attribute. The `%TYPE` attribute supplies the data type of a table column or another variable, ensuring the correct data type assignment.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about the `%TYPE` attribute
- *Oracle Database PL/SQL Language Reference* for the syntax of the `%TYPE` attribute

Tutorial: Changing Declarations to Use the `%TYPE` Attribute

This tutorial shows how to use the SQL Developer tool Edit to change the declarations of the variables, constants, and formal parameters of the `EMP_EVAL.calculate_score` function (shown in ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16) to declarations that use the `%TYPE` attribute.

To change the declarations in `calculate_score` to use `%TYPE`:

1. On the Connections tab, expand the `hr_conn` information by clicking the plus sign (+) to the left of the `hr_conn` icon.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Expand **EMP_EVAL**.

A list appears.

4. Right-click **EMP_EVAL Body**.

A list of choices appears.

5. Click **Edit**.

The `EMP_EVAL Body` pane appears, showing the code for the package body:

```
CREATE OR REPLACE
PACKAGE BODY emp_eval AS

    PROCEDURE eval_department ( dept_id IN NUMBER ) AS
    BEGIN
        /* TODO implementation required */
        NULL;
    END eval_department;

    FUNCTION calculate_score ( evaluation_id IN NUMBER
                              , performance_id IN NUMBER )
    RETURN NUMBER AS
```

```
n_score      NUMBER(1,0);           -- variable
n_weight     NUMBER;                -- variable
max_score    CONSTANT NUMBER(1,0) := 9; -- constant, initial value 9
max_weight   CONSTANT NUMBER(8,8) := 1; -- constant, initial value 1
BEGIN
    /* TODO implementation required */
    RETURN NULL;
END calculate_score;

END emp_eval;
```

6. In the code for the function, make the changes shown in bold font:

```
FUNCTION calculate_score ( evaluation_id IN SCORES.EVALUATION_ID%TYPE
                           , performance_id IN SCORES.PERFORMANCE_ID%TYPE)
    RETURN NUMBER AS
n_score      SCORES.SCORE%TYPE;
n_weight     PERFORMANCE_PARTS.WEIGHT%TYPE;
max_score    CONSTANT SCORES.SCORE%TYPE := 9;
max_weight   CONSTANT PERFORMANCE_PARTS.WEIGHT%TYPE := 1;
```

7. Right-click **EMP_EVAL**.

A list of choices appears.

8. Click **Edit**.

The EMP_EVAL pane opens, showing the CREATE PACKAGE statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

PROCEDURE eval_department(dept_id IN NUMBER);
FUNCTION calculate_score(evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
    RETURN NUMBER;

END emp_eval;
```

9. In the code for the function, make the changes shown in bold font:

```
FUNCTION calculate_score(evaluation_id IN scores.evaluation_id%TYPE
                        , performance_id IN scores.performance_id%TYPE)
```

10. Right-click **EMP_EVAL**.

A list of choices appears.

11. Click **Compile**.

Assigning Values to Variables

You can assign a value to a variable in these ways:

- Use the assignment operator to assign it the value of an expression.
- Use the SELECT INTO or FETCH statement to assign it a value from a table.
- Pass it to a subprogram as an OUT or IN OUT parameter, and then assign the value inside the subprogram
- Bind the variable to a value.

Topics:

- [Assigning Values to Variables with the Assignment Operator](#)
- [Assigning Values to Variables with the SELECT INTO Statement](#)

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about assigning values to variables
- *Oracle Database 2 Day + .NET Developer's Guide* for information about binding variables
- *Oracle Database 2 Day + PHP Developer's Guide* for information about binding variables
- *Oracle Database 2 Day + Java Developer's Guide* for information about binding variables
- *Oracle Database 2 Day + Application Express Developer's Guide* for information about binding variables

Assigning Values to Variables with the Assignment Operator

With the assignment operator (`:=`), you can assign the value of an expression to a variable in either the declarative or executable part of a subprogram.

In the declarative part of a subprogram, you can assign an initial value to a variable when you declare it. The syntax is:

```
variable_name data_type := expression;
```

In the executable part of a subprogram, you can assign a value to a variable with an assignment statement. The syntax is:

```
variable_name := expression;
```

[Example 7-1](#) shows, in bold font, the changes to make to the `EMP_EVAL.calculate_score` function to add a variable, `running_total`, and use it as the return value of the function. The assignment operator appears in both the declarative and executable parts of the function. (The data type of `running_total` must be `NUMBER`, rather than `SCORES.SCORE%TYPE` or `PERFORMANCE_PARTS.WEIGHT%TYPE`, because it holds the product of two `NUMBER` values with different precisions and scales.)

Example 7-1 Assigning Values to a Variable with Assignment Operator

```
FUNCTION calculate_score(evaluation_id IN SCORES.EVALUATION_ID%TYPE
                        , performance_id IN SCORES.PERFORMANCE_ID%TYPE)
RETURN NUMBER AS
    n_score      SCORES.SCORE%TYPE;
    n_weight     PERFORMANCE_PARTS.WEIGHT%TYPE;
    running_total NUMBER := 0;
    max_score    CONSTANT SCORES.SCORE%TYPE := 9;
    max_weight   CONSTANT PERFORMANCE_PARTS.WEIGHT%TYPE:= 1;
BEGIN
    running_total := max_score * max_weight;
    RETURN running_total;
END calculate_score;
```

See Also:

- *Oracle Database PL/SQL Language Reference* for variable declaration syntax
- *Oracle Database PL/SQL Language Reference* for assignment statement syntax

Assigning Values to Variables with the SELECT INTO Statement

To use table values in subprograms or packages, you must assign them to variables with `SELECT INTO` statements.

[Example 7–2](#) shows, in bold font, the changes to make to the `EMP_EVAL.calculate_score` function to have it calculate `running_total` from table values.

Example 7–2 Assigning Table Values to Variables with SELECT INTO

```

FUNCTION calculate_score ( evaluation_id IN scores.evaluation_id%TYPE
                          , performance_id IN scores.performance_id%TYPE )
RETURN NUMBER AS

    n_score      scores.score%TYPE;
    n_weight     performance_parts.weight%TYPE;
    running_total NUMBER := 0;
    max_score    CONSTANT scores.score%TYPE := 9;
    max_weight   CONSTANT performance_parts.weight%TYPE:= 1;
BEGIN
    SELECT s.score INTO n_score
    FROM SCORES s
    WHERE evaluation_id = s.evaluation_id
    AND performance_id = s.performance_id;

    SELECT p.weight INTO n_weight
    FROM PERFORMANCE_PARTS p
    WHERE performance_id = p.performance_id;

    running_total := n_score * n_weight;
    RETURN running_total;
END calculate_score;

```

The `add_eval` procedure in [Example 7–3](#) inserts a row into the `EVALUATIONS` table, using values from the corresponding row in the `EMPLOYEES` table. Add the `add_eval` procedure to the body of the `EMP_EVAL` package, but not to the specification. Because it is not in the specification, `add_eval` is local to the package—it can be invoked only by other subprograms in the package, not from outside the package.

Example 7–3 Inserting a Table Row with Values from Another Table

```

PROCEDURE add_eval ( employee_id IN EMPLOYEES.EMPLOYEE_ID%TYPE
                    , today IN DATE )
AS
    job_id      EMPLOYEES.JOB_ID%TYPE;
    manager_id  EMPLOYEES.MANAGER_ID%TYPE;
    department_id EMPLOYEES.DEPARTMENT_ID%TYPE;
BEGIN
    SELECT e.job_id INTO job_id
    FROM EMPLOYEES e
    WHERE employee_id = e.employee_id;

    SELECT e.manager_id INTO manager_id

```

```
FROM EMPLOYEES e
WHERE employee_id = e.employee_id;

SELECT e.department_id INTO department_id
FROM EMPLOYEES e
WHERE employee_id = e.employee_id;

INSERT INTO EVALUATIONS (
    evaluation_id,
    employee_id,
    evaluation_date,
    job_id,
    manager_id,
    department_id,
    total_score
)
VALUES (
    evaluations_seq.NEXTVAL,    -- evaluation_id
    add_eval.employee_id,      -- employee_id
    add_eval.today,            -- evaluation_date
    add_eval.job_id,           -- job_id
    add_eval.manager_id,       -- manager_id
    add_eval.department_id,    -- department_id
    0                          -- total_score
);
END add_eval;
```

See Also: *Oracle Database PL/SQL Language Reference* for more information about the `SELECT INTO` statement

Controlling Program Flow

Unlike SQL, which runs statements in the order in which you enter them, PL/SQL has control statements that let you control the flow of your program.

Topics:

- [About Control Statements](#)
- [Using the IF Statement](#)
- [Using the CASE Statement](#)
- [Using the FOR LOOP Statement](#)
- [Using the WHILE LOOP Statement](#)
- [Using the Basic LOOP and EXIT WHEN Statements](#)

About Control Statements

PL/SQL has three categories of control statements:

- **Conditional selection statements**, which let you execute different statements for different data values.

The conditional selection statements are `IF` and `CASE`.

- **Loop statements**, which let you repeat the same statements with a series of different data values.

The loop statements are `FOR LOOP`, `WHILE LOOP` and `basic LOOP`.

The `EXIT` statement transfers control to the end of a loop. The `CONTINUE` statement exits the current iteration of a loop and transfers control to the next iteration. Both `EXIT` and `CONTINUE` have an optional `WHEN` clause, in which you can specify a condition.

- **Sequential control statements**, which let you go to a specified, labeled statement, or to do nothing.

The sequential control statements are `GOTO` and `NUL`.

See Also:

- *Oracle Database PL/SQL Language Reference* for an overview of PL/SQL control statements

Using the IF Statement

The `IF` statement either executes or skips a sequence of statements, depending on the value of a Boolean expression.

The `IF` statement has this syntax:

```
IF boolean_expression THEN statement [, statement ]
[ ELSEIF boolean_expression THEN statement [, statement ] ]...
[ ELSE statement [, statement ] ]
END IF;
```

Suppose that your company evaluates employees twice a year in the first 10 years of employment, but only once a year afterward. You want a function that returns the evaluation frequency for an employee. You can use an `IF` statement to determine the return value of the function, as in [Example 7-4](#).

Add the `eval_frequency` function to the body of the `EMP_EVAL` package, but not to the specification. Because it is not in the specification, `eval_frequency` is local to the package—it can be invoked only by other subprograms in the package, not from outside the package.

Example 7-4 IF Statement that Determines Return Value of Function

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;
    ELSE
        eval_freq := 2;
    END IF;

    RETURN eval_freq;
END eval_frequency;
```

See Also:

- *Oracle Database PL/SQL Language Reference* for the syntax of the IF statement
- *Oracle Database PL/SQL Language Reference* for more information about using the IF statement

Using the CASE Statement

The CASE statement chooses from a sequence of conditions, and executes the corresponding statement.

The simple CASE statement evaluates a single expression and compares it to several potential values. It has this syntax:

```
CASE expression
WHEN value THEN statement
[ WHEN value THEN statement ]...
[ ELSE statement [, statement ]... ]
END CASE;
```

The searched CASE statement evaluates multiple Boolean expressions and chooses the first one whose value is TRUE. For information about the searched CASE statement, see *Oracle Database PL/SQL Language Reference*.

Tip: When you can use either a CASE statement or nested IF statements, use a CASE statement—it is both more readable and more efficient.

Suppose that, if an employee is evaluated only once a year, you want the eval_frequency function to suggest a salary increase, which depends on the JOB_ID.

Add the CASE statement shown in [Example 7–5](#) to the eval_frequency function. (For information about the procedure that prints the strings, DBMS_OUTPUT.PUT_LINE, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 7–5 CASE Statement that Determines Which String to Print

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq    PLS_INTEGER;
    j_id        EMPLOYEES.JOB_ID%TYPE;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;

        SELECT JOB_ID INTO j_id
        FROM EMPLOYEES
        WHERE EMPLOYEE_ID = emp_id;
```

```

CASE j_id
  WHEN 'PU_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 8% salary increase for employee # ' || emp_id);
  WHEN 'SH_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 7% salary increase for employee # ' || emp_id);
  WHEN 'ST_CLERK' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 6% salary increase for employee # ' || emp_id);
  WHEN 'HR_REP' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 5% salary increase for employee # ' || emp_id);
  WHEN 'PR_REP' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 5% salary increase for employee # ' || emp_id);
  WHEN 'MK_REP' THEN DBMS_OUTPUT.PUT_LINE(
    'Consider 4% salary increase for employee # ' || emp_id);
  ELSE DBMS_OUTPUT.PUT_LINE(
    'Nothing to do for employee #' || emp_id);
END CASE;
ELSE
  eval_freq := 2;
END IF;

RETURN eval_freq;
END eval_frequency;

```

See Also:

- ["Using CASE Expressions in Queries"](#) on page 4-29
- *Oracle Database PL/SQL Language Reference* for the syntax of the CASE statement
- *Oracle Database PL/SQL Language Reference* for more information about using the CASE statement

Using the FOR LOOP Statement

The FOR LOOP statement repeats a sequence of statements once for each integer in the range *lower_bound* through *upper_bound*. Its syntax is:

```

FOR counter IN lower_bound..upper_bound LOOP
  statement [, statement ]...
END LOOP;

```

The statements between LOOP and END LOOP can use *counter*, but cannot change its value.

Suppose that, instead of only suggesting a salary increase, you want the *eval_frequency* function to report what the salary would be if it increased by the suggested amount every year for five years.

Change the *eval_frequency* function as shown in bold font in [Example 7-6](#). (For information about the procedures that prints the strings, *DBMS_OUTPUT.PUT_LINE*, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 7-6 FOR LOOP Statement that Computes Salary After Five Years

```

FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
  RETURN PLS_INTEGER
AS
  h_date      EMPLOYEES.HIRE_DATE%TYPE;
  today       EMPLOYEES.HIRE_DATE%TYPE;
  eval_freq   PLS_INTEGER;

```

```

j_id      EMPLOYEES.JOB_ID%TYPE;
sal        EMPLOYEES.SALARY%TYPE;
sal_raise  NUMBER(3,3) := 0;

BEGIN
  SELECT SYSDATE INTO today FROM DUAL;

  SELECT HIRE_DATE INTO h_date
  FROM EMPLOYEES
  WHERE EMPLOYEE_ID = emp_id;

  IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
    eval_freq := 1;

    SELECT JOB_ID INTO j_id
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    SELECT SALARY INTO sal
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    CASE j_id
      WHEN 'PU_CLERK' THEN sal_raise := 0.08;
      WHEN 'SH_CLERK' THEN sal_raise := 0.07;
      WHEN 'ST_CLERK' THEN sal_raise := 0.06;
      WHEN 'HR_REP'   THEN sal_raise := 0.05;
      WHEN 'PR_REP'   THEN sal_raise := 0.05;
      WHEN 'MK_REP'   THEN sal_raise := 0.04;
      ELSE NULL;
    END CASE;

    IF (sal_raise != 0) THEN
      BEGIN
        DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
          ROUND((sal_raise * 100),0) ||
          '% each year for 5 years, it will be:');

        FOR i IN 1..5 LOOP
          sal := sal * (1 + sal_raise);
          DBMS_OUTPUT.PUT_LINE(ROUND(sal, 2) || ' after ' || i || ' year(s)');
        END LOOP;
      END;
    END IF;

  ELSE
    eval_freq := 2;
  END IF;

  RETURN eval_freq;
END eval_frequency;

```

See Also:

- *Oracle Database PL/SQL Language Reference* for the syntax of the FOR LOOP statement
- *Oracle Database PL/SQL Language Reference* for more information about using the FOR LOOP statement

Using the WHILE LOOP Statement

The WHILE LOOP statement repeats a sequence of statements while a condition is TRUE. Its syntax is:

```
WHILE condition LOOP
    statement [, statement ]...
END LOOP;
```

Note: If the statements between LOOP and END LOOP never cause *condition* to become FALSE, the WHILE LOOP statement runs indefinitely.

Suppose that the eval_frequency function uses the WHILE LOOP statement instead of the FOR LOOP statement, and ends after the proposed salary exceeds the maximum salary for the JOB_ID.

Change the eval_frequency function as shown in bold font in [Example 7-7](#). (For information about the procedures that prints the strings, DBMS_OUTPUT.PUT_LINE, see *Oracle Database PL/SQL Packages and Types Reference*.)

Example 7-7 WHILE LOOP Statement that Computes Salary to Maximum

```
FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq    PLS_INTEGER;
    j_id         EMPLOYEES.JOB_ID%TYPE;
    sal          EMPLOYEES.SALARY%TYPE;
    sal_raise    NUMBER(3,3) := 0;
    sal_max      JOBS.MAX_SALARY%TYPE;

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;

        SELECT JOB_ID INTO j_id
        FROM EMPLOYEES
        WHERE EMPLOYEE_ID = emp_id;

        SELECT SALARY INTO sal
        FROM EMPLOYEES
        WHERE EMPLOYEE_ID = emp_id;

        SELECT MAX_SALARY INTO sal_max
        FROM JOBS
        WHERE JOB_ID = j_id;

        CASE j_id
            WHEN 'PU_CLERK' THEN sal_raise := 0.08;
            WHEN 'SH_CLERK' THEN sal_raise := 0.07;
```

```

        WHEN 'ST_CLERK' THEN sal_raise := 0.06;
        WHEN 'HR_REP'   THEN sal_raise := 0.05;
        WHEN 'PR_REP'   THEN sal_raise := 0.05;
        WHEN 'MK_REP'   THEN sal_raise := 0.04;
        ELSE NULL;
    END CASE;

    IF (sal_raise != 0) THEN
        BEGIN
            DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
                ROUND((sal_raise * 100),0) ||
                '% each year, it will be:');

            WHILE sal <= sal_max LOOP
                sal := sal * (1 + sal_raise);
                DBMS_OUTPUT.PUT_LINE(ROUND(sal, 2));
            END LOOP;

            DBMS_OUTPUT.PUT_LINE('Maximum salary for this job is ' || sal_max);
        END;
    END IF;
ELSE
    eval_freq := 2;
END IF;

RETURN eval_freq;
END eval_frequency;

```

See Also:

- *Oracle Database PL/SQL Language Reference* for the syntax of the WHILE LOOP statement
- *Oracle Database PL/SQL Language Reference* for more information about using the WHILE LOOP statement

Using the Basic LOOP and EXIT WHEN Statements

The basic LOOP statement repeats a sequence of statements. Its syntax is:

```

LOOP
    statement [, statement ]...
END LOOP;

```

At least one *statement* must be an EXIT statement; otherwise, the LOOP statement runs indefinitely.

The EXIT WHEN statement (the EXIT statement with its optional WHEN clause) exits a loop when a condition is TRUE and transfers control to the end of the loop.

In the eval_frequency function, in the last iteration of the WHILE LOOP statement, the last computed value usually exceeds the maximum salary.

Change the WHILE LOOP statement to a basic LOOP statement that includes an EXIT WHEN statement, as shown in [Example 7–8](#).

Example 7–8 Using the EXIT WHEN Statement

```

FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
    RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;

```

```

today      EMPLOYEES.HIRE_DATE%TYPE;
eval_freq  PLS_INTEGER;
j_id       EMPLOYEES.JOB_ID%TYPE;
sal        EMPLOYEES.SALARY%TYPE;
sal_raise  NUMBER(3,3) := 0;
sal_max    JOBS.MAX_SALARY%TYPE;

BEGIN
  SELECT SYSDATE INTO today FROM DUAL;

  SELECT HIRE_DATE INTO h_date
  FROM EMPLOYEES
  WHERE EMPLOYEE_ID = emp_id;

  IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
    eval_freq := 1;

    SELECT JOB_ID INTO j_id
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    SELECT SALARY INTO sal
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    SELECT MAX_SALARY INTO sal_max
    FROM JOBS
    WHERE JOB_ID = j_id;

    CASE j_id
      WHEN 'PU_CLERK' THEN sal_raise := 0.08;
      WHEN 'SH_CLERK' THEN sal_raise := 0.07;
      WHEN 'ST_CLERK' THEN sal_raise := 0.06;
      WHEN 'HR_REP'   THEN sal_raise := 0.05;
      WHEN 'PR_REP'   THEN sal_raise := 0.05;
      WHEN 'MK_REP'   THEN sal_raise := 0.04;
      ELSE NULL;
    END CASE;

    IF (sal_raise != 0) THEN
      BEGIN
        DBMS_OUTPUT.PUT_LINE('If salary ' || sal || ' increases by ' ||
          ROUND((sal_raise * 100),0) ||
          '% each year, it will be:');

        LOOP
          sal := sal * (1 + sal_raise);
          EXIT WHEN sal > sal_max;
          DBMS_OUTPUT.PUT_LINE(ROUND(sal,2));
        END LOOP;

        DBMS_OUTPUT.PUT_LINE('Maximum salary for this job is ' || sal_max);
      END;
    END IF;
  ELSE
    eval_freq := 2;
  END IF;

  RETURN eval_freq;
END eval_frequency;

```

About Records

A **record** is a PL/SQL composite variable that can store data values of different types, similar to a `struct` type in C, C++, or Java. The internal components of a record are called **fields**. To access a record field, you use **dot notation**: *record_name.field_name*.

You can treat record fields like scalar variables. You can also pass entire records as subprogram parameters (if neither the sending nor receiving subprogram is a standalone stored subprogram).

Records are useful for holding data from table rows, or from certain columns of table rows. Each record field corresponds to a table column.

There are three ways to create a record:

- Declare a RECORD type, and then declare a variable of that type.

The syntax is:

```
TYPE record_name IS RECORD
  ( field_name data_type [:= initial_value]
    [, field_name data_type [:= initial_value ] ]... );

variable_name record_name;
```

- Declare a variable of the type *table_name%ROWTYPE*.

The fields of the record have the same names and data types as the columns of the table.

- Declare a variable of the type `cursor_name%ROWTYPE`.

The fields of the record have the same names and data types as the columns of the table in the `FROM` clause of the cursor `SELECT` statement.

See Also:

- *Oracle Database PL/SQL Language Reference* for the syntax of the `%ROWTYPE` attribute

Tutorial: Declaring a `RECORD` Type

This tutorial shows how to use the SQL Developer tool Edit to declare a `RECORD` type, `sal_info`, whose fields can hold salary information for an employee—job ID, minimum and maximum salary for that job ID, current salary, and suggested raise.

To declare `RECORD` type `sal_info`:

1. On the Connections tab, expand the `hr_conn` information by clicking the plus sign (+) to the left of the `hr_conn` icon.

Under the `hr_conn` icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Right-click **EMP_EVAL**.

A list of choices appears.

4. Click **Edit**.

The `EMP_EVAL` pane opens, showing the `CREATE PACKAGE` statement that created the package:

```
CREATE OR REPLACE PACKAGE emp_eval AS

PROCEDURE eval_department(dept_id IN NUMBER);
FUNCTION calculate_score(evaluation_id IN NUMBER
                        , performance_id IN NUMBER)
RETURN NUMBER;

END emp_eval;
```

5. In the `EMP_EVAL` pane, immediately before `END emp_eval`, add this code:

```
TYPE sal_info IS RECORD
( j_id      jobs.job_id%type
, sal_min   jobs.min_salary%type
, sal_max   jobs.max_salary%type
, sal       employees.salary%type
, sal_raise NUMBER(3,3) );
```

A new EMP_EVAL pane opens, showing the changed CREATE PACKAGE statement. The title of the pane is in italic font, which indicates that the changes have not been saved to the database.

6. Click the icon **Compile**.

The changed package specification compiles and is saved to the database. The title of the EMP_EVAL pane is no longer in italic font.

Now you can declare records of the type sal_info, as in ["Tutorial: Creating and Invoking a Subprogram with a Record Parameter"](#) on page 7-32.

Tutorial: Creating and Invoking a Subprogram with a Record Parameter

If you declared the RECORD type sal_info in ["Tutorial: Declaring a RECORD Type"](#) on page 7-31, this tutorial shows how to use the SQL Developer tool Edit to do the following:

- Create a procedure, salary_schedule, which has a parameter of type sal_info.
- Change the eval_frequency function so that it declares a record, emp_sal, of the type sal_info, populates its fields, and passes it to the salary_schedule procedure.

Because eval_frequency will invoke salary_schedule, the declaration of salary_schedule must precede the declaration of eval_frequency (otherwise, the package will not compile). However, the definition of salary_schedule can be anywhere in the package body.

To create salary_schedule and change eval_frequency:

1. On the Connections tab, expand the hr_conn information by clicking the plus sign (+) to the left of the hr_conn icon.

Under the hr_conn icon, a list of schema object types appears.

2. Expand **Packages**.

A list of packages appears.

3. Expand **EMP_EVAL**.

A list appears.

4. Right-click **EMP_EVAL Body**.

A list of choices appears.

5. Click **Edit**.

The EMP_EVAL Body pane appears, showing the code for the package body.

6. In the EMP_EVAL Body pane, immediately before END emp_eval, add this definition of the salary_schedule procedure:

```
PROCEDURE salary_schedule (emp IN sal_info) AS
    accumulating_sal NUMBER;
BEGIN
    DBMS_OUTPUT.PUT_LINE('If salary ' || emp.sal ||
        ' increases by ' || ROUND((emp.sal_raise * 100),0) ||
        '% each year, it will be:');

    accumulating_sal := emp.sal;

    WHILE accumulating_sal <= emp.sal_max LOOP
```

```

        accumulating_sal := accumulating_sal * (1 + emp.sal_raise);
        DBMS_OUTPUT.PUT_LINE(ROUND(accumulating_sal,2) || ', ');
    END LOOP;
END salary_schedule;

```

A new EMP_EVAL Body pane opens, showing the changed CREATE PACKAGE BODY statement. The title of the pane is in italic font, which indicates that the changes have not been saved to the database.

7. In the EMP_EVAL Body pane, enter the code shown in bold font, in this position:

```

create or replace
PACKAGE BODY EMP_EVAL AS

FUNCTION eval_frequency (emp_id EMPLOYEES.EMPLOYEE_ID%TYPE)
RETURN PLS_INTEGER;
PROCEDURE salary_schedule(emp IN sal_info);
PROCEDURE add_eval(employee_id IN employees.employee_id%type, today IN DATE);

PROCEDURE eval_department (dept_id IN NUMBER) AS

```

8. Edit the eval_frequency function, making the changes shown in bold font:

```

FUNCTION eval_frequency (emp_id EMPLOYEES.EMPLOYEE_ID%TYPE)
RETURN PLS_INTEGER
AS
    h_date      EMPLOYEES.HIRE_DATE%TYPE;
    today       EMPLOYEES.HIRE_DATE%TYPE;
    eval_freq   PLS_INTEGER;
emp_sal      SAL_INFO; -- replaces sal, sal_raise, and sal_max

BEGIN
    SELECT SYSDATE INTO today FROM DUAL;

    SELECT HIRE_DATE INTO h_date
    FROM EMPLOYEES
    WHERE EMPLOYEE_ID = emp_id;

    IF ((h_date + (INTERVAL '120' MONTH)) < today) THEN
        eval_freq := 1;

/* populate emp_sal */

SELECT JOB_ID INTO emp_sal.j_id FROM EMPLOYEES
WHERE EMPLOYEE_ID = emp_id;

SELECT MIN_SALARY INTO emp_sal.sal_min FROM JOBS
WHERE JOB_ID = emp_sal.j_id;

SELECT MAX_SALARY INTO emp_sal.sal_max FROM JOBS
WHERE JOB_ID = emp_sal.j_id;

SELECT SALARY INTO emp_sal.sal FROM EMPLOYEES
WHERE EMPLOYEE_ID = emp_id;

emp_sal.sal_raise := 0; -- default

CASE emp_sal.j_id
    WHEN 'PU_CLERK' THEN emp_sal.sal_raise := 0.08;
    WHEN 'SH_CLERK' THEN emp_sal.sal_raise := 0.07;
    WHEN 'ST_CLERK' THEN emp_sal.sal_raise := 0.06;

```

```

        WHEN 'HR_REP' THEN emp_sal.sal_raise := 0.05;
        WHEN 'PR_REP' THEN emp_sal.sal_raise := 0.05;
        WHEN 'MK_REP' THEN emp_sal.sal_raise := 0.04;
        ELSE NULL;
    END CASE;

    IF (emp_sal.sal_raise != 0) THEN
        salary_schedule(emp_sal);
    END IF;
ELSE
    eval_freq := 2;
END IF;

RETURN eval_freq;
END eval_frequency;

```

9. Click **Compile**.

About Cursors

When Oracle Database executes a SQL statement, it stores the result set and processing information in an unnamed private SQL area. A pointer to this unnamed area, called a **cursor**, lets you retrieve the rows of the result set one at a time. **Cursor attributes** return information about the state of the cursor.

Every time you run either a SQL DML statement or a PL/SQL `SELECT INTO` statement, PL/SQL opens an **implicit cursor**. You can get information about this cursor from its attributes, but you cannot control it. After the statement runs, the database closes the cursor; however, its attribute values remain available until another DML or `SELECT INTO` statement runs.

PL/SQL also lets you declare explicit cursors. An **explicit cursor** has a name and is associated with a query (SQL `SELECT` statement)—usually one that returns multiple rows. After declaring an explicit cursor, you must open it (with the `OPEN` statement), fetch rows one at a time from the result set (with the `FETCH` statement), and close the cursor (with the `CLOSE` statement). After closing the cursor, you can neither fetch records from the result set nor see the cursor attribute values.

The syntax for the value of an implicit cursor attribute is *SQLAttribute* (for example, `SQL%FOUND`). *SQLAttribute* always refers to the most recently run DML or `SELECT INTO` statement.

The syntax for the value of an explicit cursor attribute is *cursor_name* immediately followed by *attribute* (for example, `c1%FOUND`).

[Table 7-1](#) lists the cursor attributes and the values that they can return. (Implicit cursors have additional attributes that are beyond the scope of this book.)

Table 7-1 *Cursor Attribute Values*

Attribute	Values for Explicit Cursor	Values for Implicit Cursor
%FOUND	If cursor is not open, <code>INVALID_CURSOR</code> .	If no DML or <code>SELECT INTO</code> statement has run, <code>NULL</code> .
	If cursor is open but no fetch was attempted, <code>NULL</code> .	If the most recent DML or <code>SELECT INTO</code> statement returned a row, <code>TRUE</code> .
	If the most recent fetch returned a row, <code>TRUE</code> .	If the most recent DML or <code>SELECT INTO</code> statement did not return a row, <code>FALSE</code> .
	If the most recent fetch did not return a row, <code>FALSE</code> .	

Table 7–1 (Cont.) Cursor Attribute Values

Attribute	Values for Explicit Cursor	Values for Implicit Cursor
%NOTFOUND	<p>If cursor is not open, <code>INVALID_CURSOR</code>.</p> <p>If cursor is open but no fetch was attempted, <code>NULL</code>.</p> <p>If the most recent fetch returned a row, <code>FALSE</code>.</p> <p>If the most recent fetch did not return a row, <code>TRUE</code>.</p>	<p>If no DML or <code>SELECT INTO</code> statement has run, <code>NULL</code>.</p> <p>If the most recent DML or <code>SELECT INTO</code> statement returned a row, <code>FALSE</code>.</p> <p>If the most recent DML or <code>SELECT INTO</code> statement did not return a row, <code>TRUE</code>.</p>
%ROWCOUNT	If cursor is not open, <code>INVALID_CURSOR</code> ; otherwise, a number greater than or equal to zero.	<code>NULL</code> if no DML or <code>SELECT INTO</code> statement has run; otherwise, a number greater than or equal to zero.
%ISOPEN	If cursor is open, <code>TRUE</code> ; if not, <code>FALSE</code> .	Always <code>FALSE</code> .

Using an Explicit Cursor to Retrieve Result Set Rows One at a Time

The following procedure uses each necessary statement in its simplest form, but provides references to its complete syntax.

To use an explicit cursor to retrieve result set rows one at a time:**1. In the declarative part:****a. Declare the cursor:**

```
CURSOR cursor_name IS query;
```

For complete explicit cursor declaration syntax, see *Oracle Database PL/SQL Language Reference*.

b. Declare a record to hold the row returned by the cursor:

```
record_name cursor_name%ROWTYPE;
```

For complete `%ROWTYPE` syntax, see *Oracle Database PL/SQL Language Reference*.

2. In the executable part:**a. Open the cursor:**

```
OPEN cursor_name;
```

For complete `OPEN` statement syntax, see *Oracle Database PL/SQL Language Reference*.

- b. Fetch rows from the cursor (rows from the result set) one at a time, using a LOOP statement that has syntax similar to this:

```
LOOP
  FETCH cursor_name INTO record_name;
  EXIT WHEN cursor_name%NOTFOUND;
  -- Process row that is in record_name:
  statement;
  [ statement; ]...
END LOOP;
```

For complete FETCH statement syntax, see *Oracle Database PL/SQL Language Reference*.

- c. Close the cursor:

```
CLOSE cursor_name;
```

For complete CLOSE statement syntax, see *Oracle Database PL/SQL Language Reference*.

Tutorial: Using an Explicit Cursor to Retrieve Result Set Rows One at a Time

This tutorial shows how to implement the procedure EMP_EVAL.eval_department, which uses an explicit cursor, emp_cursor.

To implement the EMP_EVAL.eval_department procedure:

1. In the EMP_EVAL package specification, change the declaration of the eval_department procedure as shown in bold font:

```
PROCEDURE eval_department(dept_id IN employees.department_id%TYPE);
```

(For instructions for changing a package specification, see ["Tutorial: Changing a Package Specification"](#) on page 7-13.)

2. In the EMP_EVAL package body, change the definition of the eval_department procedure as shown in bold font:

```
PROCEDURE eval_department (dept_id IN employees.department_id%TYPE)
AS
  CURSOR emp_cursor IS
    SELECT * FROM EMPLOYEES
    WHERE DEPARTMENT_ID = dept_id;

  emp_record EMPLOYEES%ROWTYPE; -- for row returned by cursor
  all_evals  BOOLEAN; -- true if all employees in dept need evaluations
  today      DATE;

BEGIN
  today := SYSDATE;

  IF (EXTRACT(MONTH FROM today) < 6) THEN
    all_evals := FALSE; -- only new employees need evaluations
  ELSE
    all_evals := TRUE; -- all employees need evaluations
  END IF;

  OPEN emp_cursor;

  DBMS_OUTPUT.PUT_LINE (
    'Determining evaluations necessary in department # ' ||
```

```

dept_id );

LOOP
  FETCH emp_cursor INTO emp_record;
  EXIT WHEN emp_cursor%NOTFOUND;

  IF all_evals THEN
    add_eval(emp_record.employee_id, today);
  ELSIF (eval_frequency(emp_record.employee_id) = 2) THEN
    add_eval(emp_record.employee_id, today);
  END IF;
END LOOP;

DBMS_OUTPUT.PUT_LINE('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

```

CLOSE emp_cursor;
END eval_department;
```

(For a step-by-step example of changing a package body, see ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16.)

3. Compile the EMP_EVAL package specification.
4. Compile the EMP_EVAL package body.

About Cursor Variables

A **cursor variable** is like a cursor (see ["About Cursors"](#) on page 7-34), except that it is not limited to one query. You can open a cursor variable for a query, process the result set, and then use the cursor variable for another query. Cursor variables are useful for passing query results between subprograms.

To declare a cursor variable, you declare a REF CURSOR type, and then declare a variable of that type (therefore, a cursor variable is often called a REF CURSOR). A REF CURSOR type can be either strong or weak.

A **strong REF CURSOR type** specifies a **return type**, which is the RECORD type of its cursor variables. The PL/SQL compiler does not allow you to use these **strongly typed** cursor variables for queries that return rows that are not of the return type. Strong REF CURSOR types are less error-prone than weak ones, but weak ones are more flexible.

A **weak REF CURSOR type** does not specify a return type. The PL/SQL compiler accepts **weakly typed** cursor variables in any queries. Weak REF CURSOR types are interchangeable; therefore, instead of creating weak REF CURSOR types, you can use the predefined type weak cursor type SYS_REFCURSOR.

After declaring a cursor variable, you must open it for a specific query (with the OPEN FOR statement), fetch rows one at a time from the result set (with the FETCH statement), and then either close the cursor (with the CLOSE statement) or open it for another specific query (with the OPEN FOR statement). Opening the cursor variable for another query closes it for the previous query. After closing a cursor variable for a specific query, you can neither fetch records from the result set of that query nor see the cursor attribute values for that query.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about using cursor variables
- *Oracle Database PL/SQL Language Reference* for the syntax of cursor variable declaration

Using a Cursor Variable to Retrieve Result Set Rows One at a Time

The following procedure uses each of the necessary statements in its simplest form, but provides references to their complete syntax.

To use a cursor variable to retrieve result set rows one at a time:

1. In the declarative part:

a. Declare the REF CURSOR type:

```
TYPE cursor_type IS REF CURSOR [ RETURN return_type ];
```

For complete REF CURSOR type declaration syntax, see *Oracle Database PL/SQL Language Reference*.

b. Declare a cursor variable of that type:

```
cursor_variable cursor_type;
```

For complete cursor variable declaration syntax, see *Oracle Database PL/SQL Language Reference*.

c. Declare a record to hold the row returned by the cursor:

```
record_name return_type;
```

For complete information about record declaration syntax, see *Oracle Database PL/SQL Language Reference*.

2. In the executable part:

a. Open the cursor variable for a specific query:

```
OPEN cursor_variable FOR query;
```

For complete information about OPEN FOR statement syntax, see *Oracle Database PL/SQL Language Reference*.

b. Fetch rows from the cursor variable (rows from the result set) one at a time, using a LOOP statement that has syntax similar to this:

```
LOOP
  FETCH cursor_variable INTO record_name;
  EXIT WHEN cursor_variable%NOTFOUND;
  -- Process row that is in record_name:
  statement;
  [ statement; ]...
END LOOP;
```

For complete information about FETCH statement syntax, see *Oracle Database PL/SQL Language Reference*.

c. Close the cursor variable:

```
CLOSE cursor_variable;
```

Alternatively, you can open the cursor variable for another query, which closes it for the current query.

For complete information about CLOSE statement syntax, see *Oracle Database PL/SQL Language Reference*.

Tutorial: Using a Cursor Variable to Retrieve Result Set Rows One at a Time

This tutorial shows how to change the `EMP_EVAL.eval_department` procedure so that it uses a cursor variable instead of an explicit cursor, which lets it process multiple departments. The change includes adding a procedure that uses the cursor variable.

This tutorial also shows how to make `EMP_EVAL.eval_department` and `EMP_EVAL.add_eval` more efficient: Instead of passing one field of a record to `add_eval` and having `add_eval` use three queries to extract three other fields of the same record, `eval_department` passes the entire record to `add_eval`, and `add_eval` uses dot notation to access the values of the other three fields.

To change the `EMP_EVAL.eval_department` procedure to use a cursor variable:

1. In the `EMP_EVAL` package specification, add the procedure declaration and the `REF CURSOR` type definition, as shown in bold font:

```
create or replace
PACKAGE emp_eval AS

    PROCEDURE eval_department (dept_id IN employees.department_id%TYPE);

    PROCEDURE eval_everyone;

    FUNCTION calculate_score(eval_id IN scores.evaluation_id%TYPE
                           , perf_id IN scores.performance_id%TYPE)
      RETURN NUMBER;

    TYPE SAL_INFO IS RECORD
      ( j_id jobs.job_id%type
        , sal_min jobs.min_salary%type
        , sal_max jobs.max_salary%type
        , salary employees.salary%type
        , sal_raise NUMBER(3,3));

    TYPE emp_refcursor_type IS REF CURSOR RETURN employees%ROWTYPE;
END emp_eval;
```

(For instructions for changing a package specification, see ["Tutorial: Changing a Package Specification"](#) on page 7-13.)

2. In the `EMP_EVAL` package body, add a forward declaration for the procedure `eval_loop_control` and change the declaration of the procedure `add_eval`, as shown in bold font:

```
create or replace
PACKAGE BODY EMP_EVAL AS

    FUNCTION eval_frequency (emp_id IN EMPLOYEES.EMPLOYEE_ID%TYPE)
      RETURN PLS_INTEGER;

    PROCEDURE salary_schedule(emp IN sal_info);

    PROCEDURE add_eval(emp_record IN EMPLOYEES%ROWTYPE, today IN DATE);

    PROCEDURE eval_loop_control(emp_cursor IN emp_refcursor_type);
    ...
```

(For a step-by-step example of changing a package body, see ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16.)

3. Change the `eval_department` procedure to retrieve three separate result sets based on the department, and to invoke the `eval_loop_control` procedure, as shown in bold font:

```

PROCEDURE eval_department(dept_id IN employees.department_id%TYPE) AS
    emp_cursor      emp_refcursor_type;
    current_dept    departments.department_id%TYPE;

BEGIN
    current_dept := dept_id;

    FOR loop_c IN 1..3 LOOP
        OPEN emp_cursor FOR
            SELECT *
            FROM employees
            WHERE current_dept = eval_department.department_id;

        DBMS_OUTPUT.PUT_LINE
            ('Determining necessary evaluations in department #' ||
             current_dept);

        eval_loop_control(emp_cursor);

        DBMS_OUTPUT.PUT_LINE
            ('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

4. Change the `add_eval` as shown in bold font:

```

PROCEDURE add_eval(emp_record IN employees%ROWTYPE, today IN DATE)
AS
    -- (Delete local variables)
BEGIN
    INSERT INTO EVALUATIONS (
        evaluation_id,
        employee_id,
        evaluation_date,
        job_id,
        manager_id,
        department_id,
        total_score
    )
    VALUES (
        evaluations_seq.NEXTVAL,      -- evaluation_id
        emp_record.employee_id,      -- employee_id
        today,                        -- evaluation_date
        emp_record.job_id,           -- job_id
        emp_record.manager_id,      -- manager_id
        emp_record.department_id,  -- department_id
        0                             -- total_score
    );
END add_eval;
```

5. Before `END EMP_EVAL`, add the following procedure, which fetches the individual records from the result set and processes them:

```

PROCEDURE eval_loop_control (emp_cursor IN emp_refcursor_type) AS
```

```

emp_record      EMPLOYEES%ROWTYPE;
all_evals       BOOLEAN;
today           DATE;
BEGIN
  today := SYSDATE;

  IF (EXTRACT(MONTH FROM today) < 6) THEN
    all_evals := FALSE;
  ELSE
    all_evals := TRUE;
  END IF;

  LOOP
    FETCH emp_cursor INTO emp_record;
    EXIT WHEN emp_cursor%NOTFOUND;

    IF all_evals THEN
      add_eval(emp_record, today);
    ELSIF (eval_frequency(emp_record.employee_id) = 2) THEN
      add_eval(emp_record, today);
    END IF;
  END LOOP;
END eval_loop_control;

```

6. Before END EMP_EVAL, add the following procedure, which retrieves a result set that contains all employees in the company:

```

PROCEDURE eval_everyone AS
  emp_cursor emp_refcursor_type;
BEGIN
  OPEN emp_cursor FOR SELECT * FROM employees;
  DBMS_OUTPUT.PUT_LINE('Determining number of necessary evaluations. ');
  eval_loop_control(emp_cursor);
  DBMS_OUTPUT.PUT_LINE('Processed ' || emp_cursor%ROWCOUNT || ' records. ');
  CLOSE emp_cursor;
END eval_everyone;

```

7. Compile the EMP_EVAL package specification.
8. Compile the EMP_EVAL package body.

Using Associative Arrays

An associative array is a type of collection.

Topics:

- [About Collections](#)
- [About Associative Arrays](#)
- [Declaring Associative Arrays](#)
- [Populating Associative Arrays](#)
- [Traversing Dense Associative Arrays](#)
- [Traversing Sparse Associative Arrays](#)

See Also: For more information about collections:

- *Oracle Database Concepts*
- *Oracle Database PL/SQL Language Reference*

About Collections

A **collection** is a PL/SQL composite variable that stores elements of the same type in a specified order, similar to a one-dimensional array. The internal components of a collection are called **elements**. Each element has a unique subscript that identifies its position in the collection. To access a collection element, you use **subscript notation**: `collection_name(element_subscript)`.

You can treat collection elements like scalar variables. You can also pass entire collections as subprogram parameters (if neither the sending nor receiving subprogram is a standalone stored subprogram).

A **collection method** is a built-in PL/SQL subprogram that either returns information about a collection or operates on a collection. To invoke a collection method, you use **dot notation**: `collection_name.method_name`. For example, `collection_name.COUNT` returns the number of elements in the collection.

PL/SQL has three types of collections:

- Associative arrays (formerly called "PL/SQL tables" or "index-by tables")
- Nested tables
- Variable arrays (varrays)

This document explains only associative arrays.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about PL/SQL collection types
- *Oracle Database PL/SQL Language Reference* for more information about collection methods

About Associative Arrays

An **associative array** is an unbounded set of key-value pairs. Each key is unique, and serves as the subscript of the element that holds the corresponding value. Therefore, you can access elements without knowing their positions in the array, and without traversing the array.

The data type of the key can be either `PLS_INTEGER` or `VARCHAR2 (length)`.

If the data type of the key is `PLS_INTEGER`, and the associative array is **indexed by integer**, and it is **dense** (that is, it has no gaps between elements), then every element between the first and last element is defined and has a value (which can be `NULL`).

If the key type is `VARCHAR2 (length)`, the associative array is **indexed by string** (of `length` characters), and it is **sparse**; that is, it might have gaps between elements.

When traversing a dense associative array, you do not need to beware of gaps between elements; when traversing a sparse associative array, you do.

To assign a value to an associative array element, you can use an assignment operator:

```
array_name(key) := value
```

If *key* is not in the array, the assignment statement adds the *key-value* pair to the array. Otherwise, the statement changes the value of *array_name(key)* to *value*.

Associative arrays are useful for storing data temporarily. They do not use the disk space or network operations that tables require. However, because associative arrays are intended for temporary storage, you cannot manipulate them with DML statements or use `SELECT INTO` statements to assign their values to variables.

If you declare an associative array in a package, and assign values to the variable in the package body, then the associative array exists for the life of the database session. Otherwise, it exists for the life of the subprogram in which you declare it.

See Also: *Oracle Database PL/SQL Language Reference* for more information about associative arrays

Declaring Associative Arrays

To declare an associative array, you declare an associative array type, and then declare a variable of that type. The simplest syntax is:

```
TYPE array_type IS TABLE OF element_type INDEX BY key_type;

array_name array_type;
```

An efficient way to declare an associative array is with a cursor, using the following procedure. The procedure uses each necessary statement in its simplest form, but provides references to its complete syntax.

To use a cursor to declare an associative array:

1. In the declarative part:

a. Declare the cursor:

```
CURSOR cursor_name IS query;
```

For complete explicit cursor declaration syntax, see *Oracle Database PL/SQL Language Reference*.

b. Declare the associative array type:

```
TYPE array_type IS TABLE OF cursor_name%ROWTYPE
INDEX BY { PLS_INTEGER | VARCHAR2 length }
```

For complete associative array type declaration syntax, see *Oracle Database PL/SQL Language Reference*.

c. Declare an associative array variable of that type:

```
array_name array_type;
```

For complete variable declaration syntax, see *Oracle Database PL/SQL Language Reference*.

Example 7–9 uses the preceding procedure to declare two associative arrays, `employees_jobs` and `jobs_`, and then declares a third associative array, `job_titles_type`, without using a cursor. The first two arrays are indexed by integer; the third is indexed by string.

Note: The ORDER BY clause in the declaration of employees_jobs_cursor determines the storage order of the elements of the associative array employee_jobs.

Example 7–9 Declaring Associative Arrays

```
DECLARE
  -- Declare cursor:

  CURSOR employees_jobs_cursor IS
    SELECT FIRST_NAME, LAST_NAME, JOB_ID
    FROM EMPLOYEES
    ORDER BY JOB_ID, LAST_NAME, FIRST_NAME;

  -- Declare associative array type:

  TYPE employees_jobs_type IS TABLE OF employees_jobs_cursor%ROWTYPE
    INDEX BY PLS_INTEGER;

  -- Declare associative array:

  employees_jobs employees_jobs_type;

  -- Use same procedure to declare another associative array:

  CURSOR jobs_cursor IS
    SELECT JOB_ID, JOB_TITLE
    FROM JOBS;

  TYPE jobs_type IS TABLE OF jobs_cursor%ROWTYPE
    INDEX BY PLS_INTEGER;

  jobs_ jobs_type;

  -- Declare associative array without using cursor:

  TYPE job_titles_type IS TABLE OF JOBS.JOB_TITLE%TYPE
    INDEX BY JOBS.JOB_ID%TYPE; -- jobs.job_id%type is varchar2(10)

  job_titles job_titles_type;

BEGIN
  NULL;
END;
/
```

- ["About Cursors"](#) on page 7-34
- *Oracle Database PL/SQL Language Reference* for associative array declaration syntax

Populating Associative Arrays

The most efficient way to populate a dense associative array is with a cursor and the FETCH statement with the BULK COLLECT INTO clause, using the following procedure.

The procedure uses each necessary statement in its simplest form, but provides references to its complete syntax.

You cannot use the following procedure to populate a sparse associative array. Instead, you must use an assignment statement inside a loop statement. For information about loop statements, see "[Controlling Program Flow](#)" on page 7-22.

To use a cursor to populate an associative array indexed by integer:

1. If you have not done so, declare an associative array with a cursor, using the procedure in "[Declaring Associative Arrays](#)" on page 7-43.
2. In the executable part of the PL/SQL unit in which you declared the associative array:

- a. Open the cursor:

```
OPEN cursor_name;
```

For complete OPEN statement syntax, see *Oracle Database PL/SQL Language Reference*.

- b. Fetch all rows from the cursor into the associative array variable at once, using a FETCH statement with the BULK COLLECT INTO clause:

```
FETCH cursor_name BULK COLLECT INTO aa_variable;
```

For complete FETCH statement syntax, see *Oracle Database PL/SQL Language Reference*.

- c. Close the cursor:

```
CLOSE cursor_name;
```

For complete CLOSE statement syntax, see *Oracle Database PL/SQL Language Reference*.

[Example 7-10](#) uses the preceding procedure to populate the associative arrays `employees_jobs` and `jobs_`, which are indexed by integer. Then it uses an assignment statement inside a FOR LOOP statement to populate the associative array `job_titles_` type, which is indexed by string.

Example 7-10 Populating Associative Arrays

```
-- Declarative part from Example 7-9 goes here.
BEGIN
  -- Populate associative arrays indexed by integer:

  OPEN employees_jobs_cursor;
  FETCH employees_jobs_cursor BULK COLLECT INTO employees_jobs;
  CLOSE employees_jobs_cursor;

  OPEN jobs_cursor;
  FETCH jobs_cursor BULK COLLECT INTO jobs_;
  CLOSE jobs_cursor;

  -- Populate associative array indexed by string:

  FOR i IN 1..jobs_.COUNT() LOOP
    job_titles(jobs_(i).job_id) := jobs_(i).job_title;
  END LOOP;
END;
/
```

See Also: ["About Cursors"](#) on page 7-34

Traversing Dense Associative Arrays

A **dense associative array** (indexed by integer) has no gaps between elements—every element between the first and last element is defined and has a value (which can be NULL). You can traverse a dense array with a FOR LOOP statement, as in [Example 7-11](#).

When inserted in the executable part of [Example 7-10](#), after the code that populates the `employees_jobs` array, the FOR LOOP statement in [Example 7-11](#) prints the elements of the `employees_jobs` array in the order in which they were stored. Their storage order was determined by the ORDER BY clause in the declaration of `employees_jobs_cursor`, which was used to declare `employees_jobs` (see [Example 7-9](#)).

The upper bound of the FOR LOOP statement, `employees_jobs.COUNT`, invokes a collection method that returns the number of elements in the array. For more information about COUNT, see *Oracle Database PL/SQL Language Reference*.

Example 7-11 Traversing a Dense Associative Array

-- Code that populates `employees_jobs` must precede this code:

```
FOR i IN 1..employees_jobs.COUNT LOOP
  DBMS_OUTPUT.PUT_LINE(
    RPAD(employees_jobs(i).first_name, 23) ||
    RPAD(employees_jobs(i).last_name, 28) ||
    employees_jobs(i).job_id);
END LOOP;
```

Traversing Sparse Associative Arrays

A **sparse associative array** (indexed by string) might have gaps between elements. You can traverse it with a `WHILE LOOP` statement, as in [Example 7-12](#).

To run the code in [Example 7-12](#), which prints the elements of the `job_titles` array:

1. At the end of the declarative part of [Example 7-9](#), insert this variable declaration:

```
i jobs_.job_id%TYPE;
```

2. In the executable part of [Example 7-10](#), after the code that populates the `job_titles` array, insert the code from [Example 7-12](#).

[Example 7-12](#) includes two collection method invocations, `job_titles.FIRST` and `job_titles.NEXT(i)`. `job_titles.FIRST` returns the first element of `job_titles`, and `job_titles.NEXT(i)` returns the subscript that succeeds `i`. For more information about `FIRST`, see *Oracle Database PL/SQL Language Reference*. For more information about `NEXT`, see *Oracle Database PL/SQL Language Reference*.

Example 7-12 Traversing a Sparse Associative Array

```
/* Declare this variable in declarative part:
```

```
   i jobs_.job_id%TYPE;
```

```
   Add this code to the executable part,
   after code that populates job_titles:
```

```
*/
```

```
i := job_titles.FIRST;
```

```
WHILE i IS NOT NULL LOOP
```

```
    DBMS_OUTPUT.PUT_LINE(RPAD(i, 12) || job_titles(i));
```

```
    i := job_titles.NEXT(i);
```

```
END LOOP;
```

Handling Exceptions (Run-Time Errors)

Topics:

- [About Exceptions and Exception Handlers](#)
- [Handling Predefined Exceptions](#)
- [Declaring and Handling User-Defined Exceptions](#)

See Also: *Oracle Database PL/SQL Language Reference* for more information about handling PL/SQL errors

About Exceptions and Exception Handlers

When a run-time error occurs in PL/SQL code, an **exception** is raised. If the subprogram (or block) in which the exception is raised has an exception-handling part, control transfers to it; otherwise, execution stops.

Run-time errors can arise from design faults, coding mistakes, hardware failures, and many other sources. Because you cannot anticipate all possible errors, Oracle recommends including exception-handling parts in your subprograms ("[About Subprogram Structure](#)" on page 7-5 shows where to put the exception-handling part).

Oracle Database has many **predefined exceptions**, which it raises automatically when a program violates database rules or exceeds system-dependent limits. For example, if a SELECT INTO statement returns no rows, Oracle Database raises the predefined exception NO_DATA_FOUND. For a summary of predefined PL/SQL exceptions, see *Oracle Database PL/SQL Language Reference*.

PL/SQL lets you define (declare) your own exceptions. An exception declaration has this syntax:

```
exception_name EXCEPTION;
```

Unlike a predefined exception, a **user-defined exception** must be raised explicitly, using either the RAISE statement or the DBMS_STANDARD.RAISE_APPLICATION_ERROR procedure. For example:

```
IF condition THEN RAISE exception_name;
```

For information about the DBMS_STANDARD.RAISE_APPLICATION_ERROR procedure, see *Oracle Database PL/SQL Language Reference*.

The exception-handling part of a subprogram contains one or more exception handlers. An **exception handler** has this syntax:

```
WHEN { exception_name [ OR exception_name ]... | OTHERS } THEN  
    statement; [ statement; ]...
```

A WHEN OTHERS exception handler handles unexpected run-time errors. If used, it must be last. For example:

```
EXCEPTION  
    WHEN exception_1 THEN  
        statement; [ statement; ]...  
    WHEN exception_2 OR exception_3 THEN  
        statement; [ statement; ]...  
    WHEN OTHERS THEN
```

```

        statement; [ statement; ]...
END;
```

An alternative to the `WHEN OTHERS` exception handler is the `EXCEPTION_INIT` pragma, which associates a user-defined exception name with an Oracle Database error number.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about exception declaration syntax
- *Oracle Database PL/SQL Language Reference* for more information about exception handler syntax
- *Oracle Database PL/SQL Language Reference* for more information about the `EXCEPTION_INIT` pragma

Handling Predefined Exceptions

[Example 7-13](#) shows, in bold font, how to change the `EMP_EVAL.eval_department` procedure to handle the predefined exception `NO_DATA_FOUND`. Make this change and compile the changed procedure. (For an example of how to change a package body, see ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16.)

Example 7-13 Handling Predefined Exception `NO_DATA_FOUND`

```

PROCEDURE eval_department(dept_id IN employees.department_id%TYPE) AS
    emp_cursor      emp_refcursor_type;
    current_dept    departments.department_id%TYPE;

BEGIN
    current_dept := dept_id;

    FOR loop_c IN 1..3 LOOP
        OPEN emp_cursor FOR
            SELECT *
            FROM employees
            WHERE current_dept = dept_id;

        DBMS_OUTPUT.PUT_LINE
            ('Determining necessary evaluations in department #' ||
             current_dept);

        eval_loop_control(emp_cursor);

        DBMS_OUTPUT.PUT_LINE
            ('Processed ' || emp_cursor%ROWCOUNT || ' records.');
```

CLOSE emp_cursor;
current_dept := current_dept + 10;
END LOOP;

EXCEPTION
WHEN NO_DATA_FOUND THEN
DBMS_OUTPUT.PUT_LINE ('The query did not return a result set');
END eval_department;

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about predefined exceptions
- *Oracle Database PL/SQL Language Reference* for more information about handling raised exceptions

Declaring and Handling User-Defined Exceptions

[Example 7-14](#) shows, in bold font, how to change the EMP_EVAL.calculate_score function to declare and handle two user-defined exceptions, wrong_weight and wrong_score. Make this change and compile the changed function. (For an example of how to change a package body, see ["Tutorial: Declaring Variables and Constants in a Subprogram"](#) on page 7-16.)

Example 7-14 Handling User-Defined Exceptions

```

FUNCTION calculate_score ( evaluation_id IN scores.evaluation_id%TYPE
                          , performance_id IN scores.performance_id%TYPE )
RETURN NUMBER AS

    weight_wrong    EXCEPTION;
    score_wrong     EXCEPTION;
    n_score          scores.score%TYPE;
    n_weight         performance_parts.weight%TYPE;
    running_total    NUMBER := 0;
    max_score        CONSTANT scores.score%TYPE := 9;
    max_weight       CONSTANT performance_parts.weight%TYPE:= 1;
BEGIN
    SELECT s.score INTO n_score
    FROM SCORES s
    WHERE evaluation_id = s.evaluation_id
    AND performance_id = s.performance_id;

    SELECT p.weight INTO n_weight
    FROM PERFORMANCE_PARTS p
    WHERE performance_id = p.performance_id;

    BEGIN
        IF (n_weight > max_weight) OR (n_weight < 0) THEN
            RAISE weight_wrong;
        END IF;
    END;

    BEGIN
        IF (n_score > max_score) OR (n_score < 0) THEN
            RAISE score_wrong;
        END IF;
    END;

    running_total := n_score * n_weight;
    RETURN running_total;

EXCEPTION
    WHEN weight_wrong THEN
        DBMS_OUTPUT.PUT_LINE(
            'The weight of a score must be between 0 and ' || max_weight);
        RETURN -1;
    WHEN score_wrong THEN

```

```
DBMS_OUTPUT.PUT_LINE(  
    'The score must be between 0 and ' || max_score);  
RETURN -1;  
END calculate_score;
```

Using Triggers

This chapter contains the following topics:

- [About Triggers](#)
- [Creating Triggers](#)
- [Changing Triggers](#)
- [Disabling and Enabling Triggers](#)
- [About Trigger Compilation and Dependencies](#)
- [Dropping Triggers](#)

About Triggers

A **trigger** is a PL/SQL unit that is stored in the database and (if it is in the enabled state) automatically executes ("fires") in response to a specified event.

A trigger has this structure:

```
TRIGGER trigger_name
    triggering_event
    [ trigger_restriction ]
BEGIN
    triggered_action;
END;
```

The *trigger_name* must be unique for triggers in the schema. A trigger can have the same name as another kind of object in the schema (for example, a table); however, Oracle recommends using a naming convention that avoids confusion.

If the trigger is in the **enabled** state, the *triggering_event* causes the database to execute the *triggered_action* if the *trigger_restriction* is either TRUE or omitted. The *triggering_event* is associated with either a table, a view, a schema, or the database, and it is one of these:

- DML statement (described in "[About Data Manipulation Language \(DML\) Statements](#)" on page 5-1)
- DDL statement (described in "[About Data Definition Language \(DDL\) Statements](#)" on page 6-1)
- Database operation (SERVERERROR, LOGON, LOGOFF, STARTUP, or SHUTDOWN)

If the trigger is in the **disabled** state, the *triggering_event* does not cause the database to execute the *triggered_action*, even if the *trigger_restriction* is TRUE or omitted.

By default, a trigger is created in the enabled state. You can disable an enabled trigger, and enable a disabled trigger.

Unlike a subprogram, a trigger cannot be invoked directly. A trigger is invoked only by its triggering event, which can be caused by any user or application. You might be unaware that a trigger is executing unless it causes an error that is not handled properly.

A **simple trigger** can fire at exactly one of these **timing points**:

- Before the triggering event executes (statement-level **BEFORE** trigger)
- After the triggering event executes (statement-level **AFTER** trigger)
- Before each row that the event affects (row-level **BEFORE** trigger)
- After each row that the event affects (row-level **AFTER** trigger)

A **compound trigger** can fire at multiple timing points. For information about compound triggers, see *Oracle Database PL/SQL Language Reference*.

An **INSTEAD OF trigger** is defined on a view, and its triggering event is a DML statement. Instead of executing the DML statement, Oracle Database executes the **INSTEAD OF** trigger. For more information, see "[Creating an INSTEAD OF Trigger](#)" on page 8-5.

A **system trigger** is defined on a schema or the database. A trigger defined on a schema fires for each event associated with the owner of the schema (the current user). A trigger defined on a database fires for each event associated with all users.

One use of triggers is to enforce business rules that apply to all client applications. For example, suppose that data added to the **EMPLOYEES** table must have a certain format, and that many client applications can add data to this table. A trigger on the table can ensure the proper format of all data added to it. Because the trigger executes whenever any client adds data to the table, no client can circumvent the rules, and the code that enforces the rules can be stored and maintained only in the trigger, rather than in every client application. For other uses of triggers, see *Oracle Database PL/SQL Language Reference*.

See Also: *Oracle Database PL/SQL Language Reference* for complete information about triggers

Creating Triggers

To create triggers, use either the SQL Developer tool Create Trigger or the DDL statement **CREATE TRIGGER**. This topic shows how to use both of these ways to create triggers.

By default, a trigger is created in the enabled state. To create a trigger in disabled state, use the **CREATE TRIGGER** statement with the **DISABLE** clause.

Note: To create triggers, you must have appropriate privileges; however, for this discussion and simple application, you do not need this additional information.

Topics:

- [About OLD and NEW Pseudorecords](#)
- [Tutorial: Creating a Trigger that Logs Table Changes](#)

- [Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted](#)
- [Creating an INSTEAD OF Trigger](#)
- [Creating Triggers that Log LOGON and LOGOFF Events](#)

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user HR from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6.

See Also:

- *Oracle Database SQL Developer User's Guide* for information about SQL Developer dialog boxes for creating objects
- *Oracle Database PL/SQL Language Reference* for more information about the CREATE TRIGGER statement
- ["Editing Installation Script Files that Create Triggers"](#) on page 10-6

About OLD and NEW Pseudorecords

When a row-level trigger fires, the PL/SQL run-time system creates and populates the two pseudorecords OLD and NEW. They are called pseudorecords because they have some, but not all, of the properties of records.

For the row that the trigger is processing:

- For an INSERT trigger, OLD contains no values, and NEW contains the new values.
- For an UPDATE trigger, OLD contains the old values, and NEW contains the new values.
- For a DELETE trigger, OLD contains the old values, and NEW contains no values.

To reference a pseudorecord, put a colon before its name—:OLD or :NEW—as in [Example 8-1](#).

See Also: *Oracle Database PL/SQL Language Reference* for more information about OLD and NEW pseudorecords

Tutorial: Creating a Trigger that Logs Table Changes

This tutorial shows how to use the CREATE TRIGGER statement to create a trigger, EVAL_CHANGE_TRIGGER, which adds a row to the table EVALUATIONS_LOG whenever an INSERT, UPDATE, or DELETE statement changes the EVALUATIONS table.

The trigger adds the row *after* the triggering statement executes, and uses the **conditional predicates** INSERTING, UPDATING, and DELETING to determine which of the three possible DML statements fired the trigger.

EVAL_CHANGE_TRIGGER is a **statement-level trigger** and an **AFTER trigger**.

This trigger is part of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create EVALUATIONS_LOG and EVAL_CHANGE_TRIGGER:

1. Create the EVALUATIONS_LOG table:

```
CREATE TABLE EVALUATIONS_LOG ( log_date DATE
                                , action VARCHAR2(50));
```

2. Create EVAL_CHANGE_TRIGGER:

```
CREATE OR REPLACE TRIGGER EVAL_CHANGE_TRIGGER
  AFTER INSERT OR UPDATE OR DELETE
  ON EVALUATIONS
DECLARE
  log_action EVALUATIONS_LOG.action%TYPE;
BEGIN
  IF INSERTING THEN
    log_action := 'Insert';
  ELSIF UPDATING THEN
    log_action := 'Update';
  ELSIF DELETING THEN
    log_action := 'Delete';
  ELSE
    DBMS_OUTPUT.PUT_LINE('This code is not reachable.');
```

```
END IF;

INSERT INTO EVALUATIONS_LOG (log_date, action)
VALUES (SYSDATE, log_action);
END;
```

Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted

The sequence `EVALUATIONS_SEQ`, created in ["Creating and Managing Sequences"](#) on page 6-20, generates primary keys for the `EVALUATIONS` table. However, these primary keys are not inserted into the table automatically.

This tutorial shows how to use the SQL Developer Create Trigger tool to create a trigger named `NEW_EVALUATION_TRIGGER`, which fires *before* a row is inserted into the `EVALUATIONS` table, and generates the unique number for the primary key of that row, using `evaluations_seq`. The trigger fires once *for each row* affected by the triggering `INSERT` statement.

`NEW_EVALUATION_TRIGGER` is a **row-level trigger** and a **BEFORE trigger**.

This trigger is part of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create the `NEW_EVALUATION` trigger:

1. On the Connections tab, expand `hr_conn`.

Under the `hr_conn` icon, a list of schema object types appears.

2. Right-click **Triggers**.

A list of choices appears.

3. Click **New Trigger**.

The Create Trigger window opens. The field Schema has the value `HR` and the field Name has the default value `TRIGGER1`.

4. In the Name field, type `NEW_EVALUATION_TRIGGER` over the default value.

5. Click the tab **Trigger**.

The Trigger pane appears. By default, the field Trigger Type has the value `TABLE`, the check box Enabled is selected, the field Table Owner has the value `HR`, the field Table Name has the value `COUNTRIES`, the options Before and Statement Level are

selected, the options After and Row Level are deselected, and the check boxes Insert, Update, and Delete are deselected.

6. In the field Table Name, from the drop-down menu, select **EVALUATIONS**.

7. Select the option **Row Level**.

The option Statement Level is now deselected.

8. Select the check box **Insert**.

9. Click **OK**.

The `NEW_EVALUATION_TRIGGER` pane opens, showing the CREATE TRIGGER statement that created the trigger:

```
CREATE OR REPLACE
TRIGGER NEW_EVALUATION_TRIGGER
BEFORE INSERT ON EVALUATIONS
FOR EACH ROW
BEGIN
    NULL;
END;
```

10. In the CREATE TRIGGER statement, replace NULL with this:

```
:NEW.evaluation_id := evaluations_seq.NEXTVAL
```

The title of the `NEW_EVALUATION_TRIGGER` pane is in italic font, indicating that the trigger is not yet saved in the database.

11. From the File menu, select **Save**.

Oracle Database compiles the procedure and saves it. The title of the `NEW_EVALUATION_TRIGGER` pane is no longer in italic font.

Creating an INSTEAD OF Trigger

A view presents the output of a query as a table. If you want to change a view as you would change a table, you must create **INSTEAD OF** triggers. Instead of changing the view, they change the underlying tables.

For example, consider the view `EMP_LOCATIONS`, whose `NAME` column is created from the `LAST_NAME` and `FIRST_NAME` columns of the `EMPLOYEES` table:

```
CREATE VIEW EMP_LOCATIONS AS
SELECT e.EMPLOYEE_ID,
       e.LAST_NAME || ', ' || e.FIRST_NAME NAME,
       d.DEPARTMENT_NAME DEPARTMENT,
       l.CITY CITY,
       c.COUNTRY_NAME COUNTRY
FROM EMPLOYEES e, DEPARTMENTS d, LOCATIONS l, COUNTRIES c
WHERE e.DEPARTMENT_ID = d.DEPARTMENT_ID AND
      d.LOCATION_ID = l.LOCATION_ID AND
      l.COUNTRY_ID = c.COUNTRY_ID
ORDER BY LAST_NAME;
```

To update `EMP_LOCATIONS.NAME`, you must update `EMPLOYEES.LAST_NAME` and `EMPLOYEES.FIRST_NAME`. This is what the **INSTEAD OF** trigger in [Example 8–1](#) does.

This trigger is part of the sample application that the tutorials and examples in this document show how to develop and deploy.

NEW and OLD are **pseudorecords** that the PL/SQL run-time engine creates and populates whenever a row-level trigger fires. OLD and NEW store the original and new values, respectively, of the record being processed by the trigger. They are called pseudorecords because they do not have all properties of PL/SQL records.

Example 8–1 Creating an INSTEAD OF Trigger

```
CREATE OR REPLACE TRIGGER update_name_view_trigger
INSTEAD OF UPDATE ON emp_locations
BEGIN
    UPDATE employees SET
        first_name = substr( :NEW.name, instr( :new.name, ',' )+2),
        last_name = substr( :NEW.name, 1, instr( :new.name, ',')-1)
    WHERE employee_id = :OLD.employee_id;
END;
```

Creating Triggers that Log LOGON and LOGOFF Events

This tutorial shows how to use the CREATE TRIGGER statement to create two triggers, hr_logon_trigger and hr_logoff_trigger. *After* someone logs on as user HR, hr_logon_trigger adds a row to the table HR_USERS_LOG. *Before* someone logs off as user HR, hr_logoff_trigger adds a row to the table HR_USERS_LOG.

hr_logon_trigger and hr_logoff_trigger are **system triggers**. hr_logon_trigger is an **AFTER trigger** and hr_logoff_trigger is a **BEFORE trigger**.

These triggers are *not* part of the sample application that the tutorials and examples in this document show how to develop and deploy.

To create HR_USERS_LOG, HR_LOGON_TRIGGER, and HR_LOGOFF_TRIGGER:

1. Create the HR_USERS_LOG table:

```
CREATE TABLE hr_users_log (
    user_name VARCHAR2(30),
    activity VARCHAR2(20),
    event_date DATE
);
```

2. Create hr_logon_trigger:

```
CREATE OR REPLACE TRIGGER hr_logon_trigger
    AFTER LOGON
    ON HR.SCHEMA
BEGIN
    INSERT INTO hr_users_log (user_name, activity, event_date)
    VALUES (USER, 'LOGON', SYSDATE);
END;
```

3. Create hr_logoff_trigger:

```
CREATE OR REPLACE TRIGGER hr_logoff_trigger
    BEFORE LOGOFF
    ON HR.SCHEMA
BEGIN
    INSERT INTO hr_users_log (user_name, activity, event_date)
    VALUES (USER, 'LOGOFF', SYSDATE);
END;
```

Changing Triggers

To change a trigger, use either the SQL Developer tool Edit or the DDL statement `CREATE TRIGGER` with the `OR REPLACE` clause.

To change a standalone stored subprogram using the Edit tool:

1. On the Connections tab, expand **hr_conn**.
Under the **hr_conn** icon, a list of schema object types appears.
2. Expand **Triggers**.
A list of triggers appears.
3. Click the trigger to change.
To the right of the Connections pane, a frame with appears. Its top tab has the name of the trigger to change. Under the top tab are subtabs.
4. Click the subtab **Code**.
The Code pane appears. It shows the code that created the trigger to change.
5. On the Code pane, click the icon **Edit**.
Another pane appears, also with the name of the trigger to change.
6. In the pane, change the code.
The title of the pane is in italic font, indicating that the change is not yet saved in the database.
7. Select **Save** from the File menu.
Oracle Database compiles the trigger and saves it. The title of the pane is no longer in italic font.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the `CREATE OR REPLACE TRIGGER` statement
- *Oracle Database PL/SQL Language Reference* for more information about the `CREATE OR REPLACE TRIGGER` statement

Disabling and Enabling Triggers

You might need to temporarily disable triggers if they reference objects that are unavailable, or if you must upload a large amount of data without the delay that triggers cause (as in a recovery operation). After the referenced objects become available, or you have finished uploading the data, you can re-enable the triggers.

To disable or enable a single trigger, use the `ALTER TRIGGER` statement with the `DISABLE` or `ENABLE` clause. For example:

```
ALTER TRIGGER eval_change_trigger DISABLE;  
ALTER TRIGGER eval_change_trigger ENABLE;
```

To disable or enable all triggers on a particular table, use the `ALTER TABLE` statement with the `DISABLE ALL TRIGGERS` or `ENABLE ALL TRIGGERS` clause. For example:

```
ALTER TABLE evaluations DISABLE ALL TRIGGERS;  
ALTER TABLE evaluations ENABLE ALL TRIGGERS;
```

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about the ALTER TRIGGER statement
- *Oracle Database SQL Language Reference* for more information about the ALTER TABLE statement

About Trigger Compilation and Dependencies

Running a CREATE TRIGGER statement compiles the trigger being created. If this compilation causes an error, the CREATE TRIGGER statement fails. To see the compilation errors, run this statement:

```
SELECT * FROM USER_ERRORS WHERE TYPE = 'TRIGGER';
```

Compiled triggers depend on the schema objects on which they are defined. For example, NEW_EVALUATION_TRIGGER depends on the EVALUATIONS table:

```
CREATE OR REPLACE
TRIGGER NEW_EVALUATION_TRIGGER
BEFORE INSERT ON EVALUATIONS
FOR EACH ROW
BEGIN
    :NEW.evaluation_id := evaluations_seq.NEXTVAL;
END;
```

To see the schema objects on which triggers depend, run this statement:

```
SELECT * FROM ALL_DEPENDENCIES WHERE TYPE = 'TRIGGER';
```

If an object on which a trigger depends is dropped, or changed such that there is a mismatch between the trigger and the object, then the trigger is invalidated. The next time the trigger is invoked, it is recompiled. To recompile a trigger immediately, run the ALTER TRIGGER statement with the COMPILE clause. For example:

```
ALTER TRIGGER NEW_EVALUATION_TRIGGER COMPILE;
```

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about trigger compilation and dependencies

Dropping Triggers

You must drop a trigger before dropping the objects on which it depends.

To drop a trigger, use either the SQL Developer navigation frame and Drop tool, or the DDL statement DROP TRIGGER.

To drop a trigger using the Drop tool:

1. On the Connections tab, expand **hr_conn**.
Under the hr_conn icon, a list of schema object types appears.
2. Expand **Triggers**.
A list of triggers appears.
3. Right-click the name of the trigger to drop.
A list of choices appears.

4. Click **Drop Trigger**.

The Drop window opens.

5. Click **Apply**.

The Confirmation window opens.

6. Click **OK**.

See Also:

- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1 for general information that applies to the DROP TRIGGER statement
- *Oracle Database PL/SQL Language Reference* for information about the DROP TRIGGER statement

Working in a Global Environment

This chapter contains the following topics:

- [About Globalization Support Features](#)
- [About Initial NLS Parameter Values](#)
- [Viewing NLS Parameter Values](#)
- [Changing NLS Parameter Values](#)
- [About Individual NLS Parameters](#)
- [Using Unicode in Globalized Applications](#)

About Globalization Support Features

Globalization support features enable you to develop multilingual applications that can be run simultaneously from anywhere in the world. An application can render the content of the user interface, and process data, using the native language and locale preferences of the user.

Note: In the past, Oracle called globalization support **National Language Support (NLS)**, but NLS is actually a subset of globalization support. NLS is the ability to choose a national language and store data using a specific character set. NLS is implemented with NLS parameters.

Topics:

- [About Language Support](#)
- [About Territory Support](#)
- [About Date and Time Formats](#)
- [About Calendar Formats](#)
- [About Numeric and Monetary Formats](#)
- [About Linguistic Sorting and String Searching](#)
- [About Length Semantics](#)
- [About Unicode and SQL National Character Data Types](#)

See Also: *Oracle Database Globalization Support Guide* for more information about globalization support features

About Language Support

Oracle Database enables you to store, process, and retrieve data in native languages. The languages that can be stored in a database are all languages written in scripts that are encoded by Oracle-supported character sets. Through the use of Unicode databases and datatypes, Oracle Database supports most contemporary languages.

Additional support is available for a subset of the languages. The database can, for example, display dates using translated month names, and can sort text data according to cultural conventions.

In this document, the term **language support** refers to the additional language-dependent functionality, and not to the ability to store text of a specific language. For example, language support includes displaying dates or sorting text according to specific locales and cultural conventions. Additionally, for some supported languages, Oracle Database provides translated error messages and a translated user interface for the database utilities.

See Also:

- ["About the NLS_LANGUAGE Parameter"](#) on page 9-10
- *Oracle Database Globalization Support Guide* for a complete list of languages that Oracle Database supports
- *Oracle Database Globalization Support Guide* for a list of languages into which Oracle Database messages are translated

About Territory Support

Oracle Database supports cultural conventions that are specific to geographical locations. The default local time format, date format, and numeric and monetary conventions depend on the local territory setting. Setting different NLS parameters enables the database session to use different cultural settings. For example, you can set the euro (EUR) as the primary currency and the Japanese yen (JPY) as the secondary currency for a given database session, even when the territory is AMERICA.

See Also:

- ["About the NLS_TERRITORY Parameter"](#) on page 9-12
- *Oracle Database Globalization Support Guide* for a complete list of territories that Oracle Database supports

About Date and Time Formats

Different countries have different conventions for displaying the hour, day, month, and year. For example:

Country	Date Format	Example	Time Format	Example
China	yyyy-mm-dd	2005-02-28	hh24:mi:ss	13:50:23
Estonia	dd.mm.yyyy	28.02.2005	hh24:mi:ss	13:50:23
Germany	dd.mm.rr	28.02.05	hh24:mi:ss	13:50:23
UK	dd/mm/yyyy	28/02/2005	hh24:mi:ss	13:50:23
U.S.	mm/dd/yyyy	02/28/2005	hh:mi:ssx ff am	1:50:23.555 PM

See Also:

- ["About the NLS_DATE_FORMAT Parameter"](#) on page 9-14
- ["About the NLS_DATE_LANGUAGE Parameter"](#) on page 9-16
- ["About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters"](#) on page 9-17
- *Oracle Database Globalization Support Guide* for information about date/time data types and time zone support
- *Oracle Database SQL Language Reference* for information about date and time formats

About Calendar Formats

Oracle Database stores this calendar information for each territory:

- **First day of the week**

Sunday in some cultures, Monday in others. Set by the `NLS_TERRITORY` parameter.

- **First week of the calendar year**

Some countries use week numbers for scheduling, planning, and bookkeeping. In the ISO standard, this week number can differ from the week number of the calendar year. For example, 1st Jan 2005 is in ISO week number 53 of 2004. An ISO week starts on Monday and ends on Sunday. To support the ISO standard, Oracle Database provides the `IW` date format element, which returns the ISO week number. The first calendar week of the year is set by the `NLS_TERRITORY` parameter.

- **Number of days and months in a year**

Oracle Database supports six calendar systems in addition to the Gregorian calendar, which is the default. These additional calendar systems are:

- Japanese Imperial

Has the same number of months and days as the Gregorian calendar, but the year starts with the beginning of each Imperial Era.

- ROC Official

Has the same number of months and days as the Gregorian calendar, but the year starts with the founding of the Republic of China.

- Persian

The first six months have 31 days each, the next five months have 30 days each, and the last month has either 29 days or (in leap year) 30 days.

- Thai Buddha uses a Buddhist calendar.

- Arabic Hijrah has 12 months and 354 or 355 days.

- English Hijrah has 12 months and 354 or 355 days.

The calendar system is specified by the `NLS_CALENDAR` parameter.

- **First year of era**

The Islamic calendar starts from the year of the Hegira. The Japanese Imperial calendar starts from the beginning of an Emperor's reign (for example, 1998 is the tenth year of the Heisei era).

See Also:

- ["About the NLS_TERRITORY Parameter"](#) on page 9-12
- ["About the NLS_CALENDAR Parameter"](#) on page 9-18
- *Oracle Database Globalization Support Guide* for information about calendar formats

About Numeric and Monetary Formats

Different countries have different numeric and monetary conventions. For example:

Country	Numeric Format	Monetary Format
China	1,234,567.89	¥1,234.56
Estonia	1 234 567,89	1 234,56 kr
Germany	1.234.567,89	1.234,56€
UK	1,234,567.89	£1,234.56
U.S.	1,234,567.89	\$1,234.56

See Also:

- ["About the NLS_NUMERIC_CHARACTERS Parameter"](#) on page 9-19
- ["About the NLS_CURRENCY Parameter"](#) on page 9-20
- ["About the NLS_ISO_CURRENCY Parameter"](#) on page 9-21
- ["About the NLS_DUAL_CURRENCY Parameter"](#) on page 9-23
- *Oracle Database Globalization Support Guide* for information about numeric and list parameters
- *Oracle Database Globalization Support Guide* for information about monetary parameters
- *Oracle Database SQL Language Reference* for information about number format models

About Linguistic Sorting and String Searching

Different languages have different sort orders (collating sequences). Also, different countries or cultures that use the same alphabets sort words differently. For example, in Danish, Æ is after Z, and Y and Ü are considered to be variants of the same letter.

See Also:

- ["About the NLS_SORT Parameter"](#) on page 9-23
- ["About the NLS_COMP Parameter"](#) on page 9-24
- *Oracle Database Globalization Support Guide* for more information about linguistic sorting and string searching

About Length Semantics

In single-byte character sets, the number of bytes and the number of characters in a string are the same. In multibyte character sets, a character or code point consists of

one or more bytes. Calculating the number of characters based on byte length can be difficult in a variable-width character set. Calculating column length in bytes is called **byte semantics**, while measuring column length in characters is called **character semantics**.

Character semantics is useful for specifying the storage requirements for multibyte strings of varying widths. For example, in a Unicode database (AL32UTF8), suppose that you must have a `VARCHAR2` column that can store up to five Chinese characters with five English characters. Using byte semantics, this column requires 15 bytes for the Chinese characters, which are 3 bytes long, and 5 bytes for the English characters, which are 1 byte long, for a total of 20 bytes. Using character semantics, the column requires 10 characters.

See Also:

- ["About the NLS_LENGTH_SEMANTICS Parameter"](#) on page 9-26
- *Oracle Database Globalization Support Guide* for information about character sets and length semantics

About Unicode and SQL National Character Data Types

Unicode is a character encoding system that defines every character in most of the spoken languages in the world. In Unicode, every character has a unique code, regardless of the platform, program, or language.

You can store Unicode characters in an Oracle Database in two ways:

- You can create a Unicode database that enables you to store UTF-8 encoded characters as SQL character datatypes (`CHAR`, `VARCHAR2`, `CLOB`, and `LONG`).
- You can declare columns and variables that have SQL national character datatypes.

The **SQL national character data types** are `NCHAR`, `NVARCHAR2`, and `NCLOB`. They are also called **Unicode data types**, because they are used only for storing Unicode data.

The national character set, which is used for all SQL national character data types, is specified when the database is created. The national character set can be either UTF8 or AL16UTF16 (default).

When you declare a column or variable of the type `NCHAR` or `NVARCHAR2`, the length that you specify is the number of characters, not the number of bytes.

See Also:

- *Oracle Database Globalization Support Guide* for more information about Unicode
- *Oracle Database Globalization Support Guide* for more information about storing Unicode characters in an Oracle Database
- *Oracle Database Globalization Support Guide* for more information about SQL national character data types

About Initial NLS Parameter Values

Except in SQL Developer, the initial values of NLS parameters are set by database initialization parameters. The DBA can set the values of initialization parameters in the initialization parameter file, and they take effect the next time the database is started.

In SQL Developer, the initial values of NLS parameters are as shown in [Table 9-1](#).

Table 9–1 Initial Values of NLS Parameters in SQL Developer

Parameter	Initial Value
NLS_CALENDAR	GREGORIAN
NLS_CHARACTERSET	AL32UTF8
NLS_COMP	BINARY
NLS_CURRENCY	\$
NLS_DATE_FORMAT	DD-MON-RR
NLS_DATE_LANGUAGE	AMERICAN
NLS_DUAL_CURRENCY	\$
NLS_ISO_CURRENCY	AMERICA
NLS_LANGUAGE	AMERICAN
NLS_LENGTH_SEMANTICS	BYTE
NLS_NCHAR_CHARACTERSET	AL16UTF16
NLS_NCHAR_CONV_EXCP	FALSE
NLS_NUMERIC_CHARACTERS	.,
NLS_SORT	BINARY
NLS_TERRITORY	AMERICA
NLS_TIMESTAMP_FORMAT	DD-MON-RR HH.MI.SSXFF AM
NLS_TIMESTAMP_TZ_FORMAT	DD-MON-RR HH.MI.SSXFF AM TZR
NLS_TIME_FORMAT	HH.MI.SSXFF AM
NLS_TIME_TZ_FORMAT	HH.MI.SSXFF AM TZR

See Also: *Oracle Database Administrator's Guide* for information about initialization parameters and initialization parameter files

Viewing NLS Parameter Values

To view the current values of NLS parameters, use the SQL Developer report National Language Support Parameters.

Note: if you are connected to the database as the database administrator user SYS, you can use this query instead of the SQL Developer report:

```
SELECT * FROM V$NLS_PARAMETERS;
```

To view the National Language Support Parameters report:

1. In the SQL Developer window, click the tab **Reports**.

The Reports pane shows a list of reports.

2. Expand **Data Dictionary Reports**.

A list of data dictionary reports appears.

3. Expand **About Your Database**.

A list of reports appears.

4. Click **National Language Support Parameters**.

The Select Connection window opens. It has a Connection field with a drop-down menu.

5. From the drop-down menu, select **hr_conn**.

6. Click **OK**.

The Select Connection window closes and the National Language Support Parameters pane appears, showing the names of the NLS parameters and their current values.

See Also: *Oracle Database SQL Developer User's Guide* for more information about SQL Developer reports

Changing NLS Parameter Values

You can change the value of one or more NLS parameters in any of these ways:

- Change the values for all SQL Developer connections, current and future.
- On the client, change the settings of the corresponding NLS environment variables.

Only on the client, the new values of the NLS environment variables override the values of the corresponding NLS parameters.

You can use environment variables to specify locale-dependent behavior for the client. For example, on a Linux system, this statement sets the value of the NLS_SORT environment variable to FRENCH, overriding the value of the NLS_SORT parameter:

```
% setenv NLS_SORT FRENCH
```

Note: Environment variables might be platform-dependent.

- Change the values only for the current session, using an ALTER SESSION statement with this syntax:

```
ALTER SESSION SET parameter_name=parameter_value
[ parameter_name=parameter_value ]... ;
```

Only in the current session, the new values override those set in all of the preceding ways.

You can use the ALTER SESSION to test your application with the settings for different locales.

- Change the values only for the current SQL function invocation.

Only for the current SQL function invocation, the new values override those set in all of the preceding ways.

Topics:

- [Changing NLS Parameter Values for All SQL Developer Connections](#)
- [Changing NLS Parameter Values for the Current SQL Function Invocation](#)

See Also:

- *Oracle Database SQL Language Reference* for more information about the `ALTER SESSION` statement
- *Oracle Database Globalization Support Guide* for more information about setting NLS parameters

Changing NLS Parameter Values for All SQL Developer Connections

The following procedure shows how to change the values of NLS parameters for all SQL Developer connections, current and future.

To change National Language Support Parameter values:

1. In the SQL Developer window, click the menu **Tools**.
A drop-down menu appears.
2. From drop-down menu, select **Preferences**.
The Preferences window opens.
3. In the Preferences window, expand **Database**.
A list of database preferences appears.
4. Click **NLS Parameters**.
A list of NLS Parameters and their current values appears. The value fields are drop-down menus.
5. From the drop-down menu to the right of each parameter whose value you want to change, select the desired value.
6. Click **OK**.

The NLS parameters now have the values that you specified. To verify these values, see ["Viewing NLS Parameter Values"](#) on page 9-6.

See Also: *Oracle Database SQL Developer User's Guide* for more information about SQL Developer preferences

Changing NLS Parameter Values for the Current SQL Function Invocation

SQL functions whose behavior depends on the values of NLS parameters are called **locale-dependent**. Some locale-dependent SQL functions have optional NLS parameters. These functions are:

- `TO_CHAR`
- `TO_DATE`
- `TO_NUMBER`
- `NLS_UPPER`
- `NLS_LOWER`
- `NLS_INITCAP`
- `NLSSORT`

In all of the preceding functions, you can specify these NLS parameters:

- `NLS_DATE_LANGUAGE`

- NLS_DATE_LANGUAGE
- NLS_NUMERIC_CHARACTERS
- NLS_CURRENCY
- NLS_ISO_CURRENCY
- NLS_DUAL_CURRENCY
- NLS_CALENDAR
- NLS_SORT

In the NLSSORT function, you can also specify these NLS parameters:

- NLS_LANGUAGE
- NLS_TERRITORY
- NLS_DATE_FORMAT

To specify NLS parameters in a function, use this syntax:

```
'parameter=value' ['parameter=value']...
```

Suppose that you want NLS_DATE_LANGUAGE to be AMERICAN when this query is evaluated:

```
SELECT last_name FROM employees WHERE hire_date > '01-JAN-1999';
```

You can set NLS_DATE_LANGUAGE to AMERICAN before running the query:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=American;
SELECT last_name FROM employees WHERE hire_date > '01-JAN-1999';
```

Alternatively, you can set NLS_DATE_LANGUAGE to AMERICAN inside the query, using the locale-dependent SQL function TO_DATE with its optional NLS_DATE_LANGUAGE parameter:

```
SELECT last_name FROM employees
WHERE hire_date > TO_DATE('01-JAN-1999', 'DD-MON-YYYY',
                        'NLS_DATE_LANGUAGE=AMERICAN');
```

Tip: Specify optional NLS parameters in locale-dependent SQL functions only in SQL statements that must be independent of the session NLS parameter values. Using session default values for NLS parameters in SQL functions usually results in better performance.

See Also: *Oracle Database Globalization Support Guide* for more information about locale-dependent SQL functions with optional NLS parameters

About Individual NLS Parameters

Topics:

- [About Locale and the NLS_LANG Parameter](#)
- [About the NLS_LANGUAGE Parameter](#)
- [About the NLS_TERRITORY Parameter](#)
- [About the NLS_DATE_FORMAT Parameter](#)
- [About the NLS_DATE_LANGUAGE Parameter](#)

- [About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters](#)
- [About the NLS_CALENDAR Parameter](#)
- [About the NLS_NUMERIC_CHARACTERS Parameter](#)
- [About the NLS_CURRENCY Parameter](#)
- [About the NLS_ISO_CURRENCY Parameter](#)
- [About the NLS_DUAL_CURRENCY Parameter](#)
- [About the NLS_SORT Parameter](#)
- [About the NLS_COMP Parameter](#)
- [About the NLS_LENGTH_SEMANTICS Parameter](#)

See Also:

- *Oracle Database Globalization Support Guide* for more information about setting up a globalization support environment
- ["Changing NLS Parameter Values"](#) on page 9-7

About Locale and the NLS_LANG Parameter

A **locale** is a linguistic and cultural environment in which a system or application runs. The simplest way to specify a locale for Oracle Database software is to set the NLS_LANG parameter.

The NLS_LANG parameter sets the default values of the parameters NLS_LANGUAGE and NLS_TERRITORY for both the server session (for example, SQL statement processing) and the client application (for example, display formatting in Oracle Database tools). The NLS_LANG parameter also sets the character set that the client application uses for data entered or displayed.

The default value of NLS_LANG is set during database installation. You can use the ALTER SESSION statement to change the values of NLS parameters, including those set by NLS_LANG, for your session. However, only the client can change the NLS settings in the client environment.

See Also:

- *Oracle Database Globalization Support Guide* for more information about specifying a locale with the NLS_LANG parameter
- *Oracle Database Globalization Support Guide* for information about languages, territories, character sets, and other locale data supported by Oracle Database
- ["About the NLS_LANGUAGE Parameter"](#) on page 9-10
- ["About the NLS_TERRITORY Parameter"](#) on page 9-12
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_LANGUAGE Parameter

Specifies: Default language of the database. Default conventions for:

- Language for server messages

- Language for names and abbreviations of days and months that are specified in the SQL functions `TO_CHAR` and `TO_DATE`
- Symbols for default-language equivalents of AM, PM, AD, and BC
- Default sorting order for character data when the `ORDER BY` clause is specified
- Writing direction
- Affirmative and negative response strings (for example, YES and NO)

Acceptable Values: Any language name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by `NLS_LANG`, described in "About Locale and the `NLS_LANG` Parameter" on page 9-10.

Sets default values of:

- `NLS_DATE_LANGUAGE`, described in "About the `NLS_DATE_LANGUAGE` Parameter" on page 9-16.
- `NLS_SORT`, described in "About the `NLS_SORT` Parameter" on page 9-23.

Example 9-1 shows how setting `NLS_LANGUAGE` to ITALIAN and GERMAN affects server messages and month abbreviations.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see "Running Queries in SQL Developer" on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-1 NLS_LANGUAGE Affects Server Message and Month Abbreviations

1. Note the current value of `NLS_LANGUAGE`.

For instructions, see "Viewing NLS Parameter Values" on page 9-6.

2. If the value in step 1 is not ITALIAN, change it:

```
ALTER SESSION SET NLS_LANGUAGE=ITALIAN;
```

3. Query a nonexistent table:

```
SELECT * FROM nonexistent_table;
```

Result:

```
SELECT * FROM nonexistent_table
*
ERROR at line 1:
ORA-00942: tabella o vista inesistente
```

4. Run this query:

```
SELECT LAST_NAME, HIRE_DATE
FROM EMPLOYEES
WHERE EMPLOYEE_ID IN (111, 112, 113);
```

Result:

LAST_NAME	HIRE_DATE
Sciarra	30- SET -97
Urman	07- MAR -98
Popp	07- DIC -99

3 rows selected.

5. Change the value of `NLS_LANGUAGE` to GERMAN:

```
ALTER SESSION SET NLS_LANGUAGE=GERMAN;
```

6. Repeat the query from step 3.

Result:

```
SELECT * FROM nonexistent_table
      *
ERROR at line 1:
ORA-00942: Tabelle oder View nicht vorhanden
```

7. Repeat the query from step 4.

Result:

```
LAST_NAME          HIRE_DATE
-----
Sciarra            30-SEP-97
Urman              07-MRZ-98
Popp               07-DEZ-99

3 rows selected.
```

8. Set `NLS_LANGUAGE` to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_LANGUAGE` parameter
- ["About Language Support"](#) on page 9-2
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_TERRITORY` Parameter

Specifies: Default conventions for:

- Date format
- Timestamp format
- Decimal character and group separator
- Local currency symbol
- ISO currency symbol
- Dual currency symbol

Acceptable Values: Any territory name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by `NLS_LANG`, described in ["About Locale and the `NLS_LANG` Parameter"](#) on page 9-10.

Sets default values of:

- `NLS_DATE_FORMAT`, described in ["About the `NLS_DATE_FORMAT` Parameter"](#) on page 9-14.

- NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT, described in "[About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters](#)" on page 9-17.
- NLS_NUMERIC_CHARACTERS, described in "[About the NLS_NUMERIC_CHARACTERS Parameter](#)" on page 9-19.
- NLS_CURRENCY, described in "[About the NLS_CURRENCY Parameter](#)" on page 9-20.
- NLS_ISO_CURRENCY, described in "[About the NLS_ISO_CURRENCY Parameter](#)" on page 9-21.
- NLS_DUAL_CURRENCY, described in "[About the NLS_DUAL_CURRENCY Parameter](#)" on page 9-23.

Example 9–2 shows how setting NLS_TERRITORY to JAPAN and AMERICA affects the currency symbol.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see "[Running Queries in SQL Developer](#)" on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9–2 NLS_TERRITORY Affects Currency Symbol

1. Note the current value of NLS_TERRITORY.

For instructions, see "[Viewing NLS Parameter Values](#)" on page 9-6.

2. If the value in step 1 is not JAPAN, change it:

```
ALTER SESSION SET NLS_TERRITORY=JAPAN;
```

3. Run this query:

```
SELECT TO_CHAR(SALARY, 'L99G999D99') SALARY
FROM EMPLOYEES
WHERE EMPLOYEE_ID IN (100, 101, 102);
```

Result:

```
SALARY
-----
          ¥24,000.00
          ¥17,000.00
          ¥17,000.00
```

3 rows selected.

4. Change the value of NLS_TERRITORY to AMERICA:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

5. Repeat the query from step 3.

Result:

```
SALARY
-----
          $24,000.00
          $17,000.00
          $17,000.00
```

3 rows selected.

6. Set `NLS_TERRITORY` to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_TERRITORY` parameter
- ["About Territory Support"](#) on page 9-2
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_DATE_FORMAT` Parameter

Specifies: Default date format to use with the `TO_CHAR` and `TO_DATE` functions (which are introduced in ["Using Conversion Functions in Queries"](#) on page 4-22).

Acceptable Values: Any any valid datetime format model. For example:

```
NLS_DATE_FORMAT='MM/DD/YYYY'
```

For information about datetime format models, see *Oracle Database SQL Language Reference*.

Default Value: Set by `NLS_TERRITORY`, described in ["About the NLS_TERRITORY Parameter"](#) on page 9-12.

The default date format might not correspond to the convention used in a given territory. To get dates in localized formats, you can use the 'DS' (short date) and 'DL' (long date) formats.

[Example 9-3](#) shows how setting `NLS_TERRITORY` to `AMERICA` and `FRANCE` affects the default, short, and long date formats.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-3 *NLS_TERRITORY Affects Date Formats*

1. Note the current value of `NLS_TERRITORY`.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value in step 1 is not `AMERICA`, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

3. Run this query:

```
SELECT hire_date "Default",
       TO_CHAR(hire_date,'DS') "Short",
       TO_CHAR(hire_date,'DL') "Long"
FROM employees
WHERE employee_id IN (111, 112, 113);
```

Result:

Default	Short	Long
30-SEP-97	9/30/1997	Tuesday, September 30, 1997
07-MAR-98	3/7/1998	Saturday, March 07, 1998
07-DEC-99	12/7/1999	Tuesday, December 07, 1999

3 rows selected.

4. Change the value of NLS_TERRITORY to FRANCE:

```
ALTER SESSION SET NLS_TERRITORY=FRANCE;
```

5. Repeat the query from step 3.

Result:

Default	Short	Long
30/09/97	30/09/1997	tuesday 30 september 1997
07/03/98	07/03/1998	saturday 7 march 1998
07/12/99	07/12/1999	tuesday 7 december 1999

3 rows selected.

(To get the names of the days and months in French, you must set either NLS_LANGUAGE or NLS_DATE_LANGUAGE to FRENCH before running the query.)

6. Set NLS_TERRITORY to the value that it had at step 1.

[Example 9-4](#) changes the value of NLS_DATE_FORMAT, overriding the default value set by NLS_TERRITORY.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-4 NLS_DATE_FORMAT Overrides NLS_TERRITORY

1. Note the current values of NLS_TERRITORY and NLS_DATE_FORMAT.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of NLS_TERRITORY in step 1 is not AMERICA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

3. If the value of NLS_DATE_FORMAT in step 1 is not 'Day Month ddth', change it:

```
ALTER SESSION SET NLS_DATE_FORMAT='Day Month ddth';
```

4. Run this query (from previous example, step 3):

```
SELECT hire_date "Default",
       TO_CHAR(hire_date,'DS') "Short",
       TO_CHAR(hire_date,'DL') "Long"
FROM employees
WHERE employee_id IN (111, 112, 113);
```

Result:

Default	Short	Long
Tuesday September 30th	9/30/1997	Tuesday, September 30, 1997
Saturday March 07th	3/7/1998	Saturday, March 07, 1998
Tuesday December 07th	12/7/1999	Tuesday, December 07, 1999

3 rows selected.

5. Set `NLS_TERRITORY` and `NLS_DATE_FORMAT` to the values that they had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_DATE_FORMAT` parameter
- *Oracle Database SQL Language Reference* for more information about the `TO_CHAR` function
- *Oracle Database SQL Language Reference* for more information about the `TO_DATE` function
- ["About Date and Time Formats"](#) on page 9-2
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_DATE_LANGUAGE` Parameter

Specifies: Language for names and abbreviations of days and months that are produced by:

- SQL functions `TO_CHAR` and `TO_DATE` (which are introduced in ["Using Conversion Functions in Queries"](#) on page 4-22)
- Default date format (set by `NLS_DATE_FORMAT`, described in ["About the NLS_DATE_FORMAT Parameter"](#) on page 9-14)
- Symbols for default-language equivalents of AM, PM, AD, and BC

Acceptable Values: Any language name that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Set by `NLS_LANGUAGE`, described in ["About the NLS_LANGUAGE Parameter"](#) on page 9-10.

[Example 9-5](#) shows how setting `NLS_DATE_LANGUAGE` to `FRENCH` and `SWEDISH` affects the displayed system date.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-5 `NLS_DATE_LANGUAGE` Affects Displayed `SYSDATE`

1. Note the current value of `NLS_DATE_LANGUAGE`.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of `NLS_DATE_LANGUAGE` in step 1 is not `FRENCH`, change it:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=FRENCH;
```

3. Run this query:

```
SELECT TO_CHAR(SYSDATE, 'Day:Dd Month yyyy') "System Date"
FROM DUAL;
```

Result:

```
System Date
-----
Mercredi:01 Octobre 2008
```

4. Change the value of NLS_DATE_LANGUAGE to SWEDISH:

```
ALTER SESSION SET NLS_DATE_LANGUAGE=SWEDISH;
```

5. Repeat the query from step 3.

Result:

```
System Date
-----
Onsdag :01 Oktober 2008
```

6. Set NLS_DATE_LANGUAGE to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_DATE_LANGUAGE parameter
- *Oracle Database SQL Language Reference* for more information about the TO_CHAR function
- *Oracle Database SQL Language Reference* for more information about the TO_DATE function
- ["About Date and Time Formats"](#) on page 9-2
- ["Changing NLS Parameter Values"](#) on page 9-7

About NLS_TIMESTAMP_FORMAT and NLS_TIMESTAMP_TZ_FORMAT Parameters

Specify: Default date format for:

- TIMESTAMP datatype
- TIMESTAMP WITH LOCAL TIME ZONE datatype

Acceptable Values: Any any valid datetime format model. For example:

```
NLS_TIMESTAMP_FORMAT='YYYY-MM-DD HH:MI:SS.FF'
NLS_TIMESTAMP_TZ_FORMAT='YYYY-MM-DD HH:MI:SS.FF TZh:TzM'
```

For information about datetime format models, see *Oracle Database SQL Language Reference*.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#) on page 9-12.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_TIMESTAMP_FORMAT` parameter
- *Oracle Database Globalization Support Guide* for more information about the `NLS_TIMESTAMP_TZ_FORMAT` parameter
- *Oracle Database Globalization Support Guide* for information about date/time data types and time zone support
- *Oracle Database SQL Language Reference* for more information about the `TIMESTAMP` datatype
- *Oracle Database SQL Language Reference* for more information about the `TIMESTAMP WITH LOCAL TIME ZONE` data type
- ["About Date and Time Formats"](#) on page 9-2
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_CALENDAR` Parameter

Specifies: Calendar system for the database.

Acceptable Values: Any calendar system that Oracle supports. For a list, see *Oracle Database Globalization Support Guide*.

Default Value: Gregorian

[Example 9–6](#) shows how setting `NLS_CALENDAR` to 'English Hijrah' and Gregorian affects the displayed system date.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9–6 *`NLS_CALENDAR` Affects Displayed SYSDATE*

1. Note the current value of `NLS_CALENDAR`.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of `NLS_CALENDAR` in step 1 is not 'English Hijrah', change it:

```
ALTER SESSION SET NLS_CALENDAR='English Hijrah';
```

3. Run this query:

```
SELECT SYSDATE FROM DUAL;
```

Result:

```
SYSDATE
-----
29 Ramadan      1429
```

4. Change the value of `NLS_CALENDAR` to 'Gregorian':

```
ALTER SESSION SET NLS_CALENDAR='Gregorian';
```

5. Run this query:

```
SELECT SYSDATE FROM DUAL;
```

Result:

```
SYSDATE
-----
30-SEP-08
```

6. Set NLS_CALENDAR to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_CALENDAR parameter
- ["About Calendar Formats"](#) on page 9-3
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_NUMERIC_CHARACTERS Parameter

Specifies: Decimal character (which separates the integer and decimal parts of a number) and group separator (which separates integer groups to show thousands and millions, for example). The group separator is the character returned by the numeric format element G.

Acceptable Values: Any two different single-byte characters except:

- A numeric character
- Plus (+)
- Minus (-)
- Less than (<)
- Greater than (>)

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#) on page 9-12.

In a SQL statement, you can represent a number as either:

- Numeric literal

A numeric literal is not enclosed in quotation marks, always uses a period (.) as the decimal character, and never contains a group separator.

- Text literal

A text literal is enclosed in single quotation marks. It is implicitly or explicitly converted to a number, if required, according to the current NLS settings.

[Example 9-7](#) shows how two different NLS_NUMERIC_CHARACTERS settings affect the displayed result of the same query.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-7 NLS_NUMERIC_CHARACTERS Affects Decimal Character and Group Separator

1. Note the current value of NLS_NUMERIC_CHARACTERS.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of `NLS_NUMERIC_CHARACTERS` in step 1 is not `','` (decimal character is comma and group separator is period), change it:

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',';
```

3. Run this query:

```
SELECT TO_CHAR(4000, '9G999D99') "Number" FROM DUAL;
```

Result:

```
Number
-----
4.000,00
```

4. Change the value of `NLS_NUMERIC_CHARACTERS` to `','` (decimal character is period and group separator is comma):

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',';
```

5. Run this query:

```
SELECT TO_CHAR(4000, '9G999D99') "Number" FROM DUAL;
```

Result:

```
Number
-----
4,000.00
```

6. Set `NLS_NUMERIC_CHARACTERS` to the value that it had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_NUMERIC_CHARACTERS` parameter
- ["About Numeric and Monetary Formats"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_CURRENCY` Parameter

Specifies: Local currency symbol (the character string returned by the numeric format element `L`).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by `NLS_TERRITORY`, described in ["About the `NLS_TERRITORY` Parameter"](#) on page 9-12.

[Example 9-8](#) changes the value of `NLS_CURRENCY`, overriding the default value set by `NLS_TERRITORY`.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-8 `NLS_CURRENCY` Overrides `NLS_TERRITORY`

1. Note the current values of `NLS_TERRITORY` and `NLS_CURRENCY`.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of NLS_TERRITORY in step 1 is not AMERICA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

3. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Salary"
FROM EMPLOYEES
WHERE salary > 13000;
```

Result:

```
Salary
-----
          $024,000.00
          $017,000.00
          $017,000.00
          $014,000.00
          $013,500.00
```

4. Change the value of NLS_CURRENCY to '¥':

```
ALTER SESSION SET NLS_CURRENCY='¥';
```

5. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Salary"
FROM EMPLOYEES
WHERE salary > 13000;
```

Result:

```
Salary
-----
          ¥024,000.00
          ¥017,000.00
          ¥017,000.00
          ¥014,000.00
          ¥013,500.00
```

6. Set NLS_TERRITORY and NLS_CURRENCY to the values that they had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_ISO_CURRENCY Parameter

Specifies: ISO currency symbol (the character string returned by the numeric format element C).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#) on page 9-12.

Local currency symbols can be ambiguous, but ISO currency symbols are unique.

[Example 9-9](#) shows that the territories AUSTRALIA and AMERICA have the same local currency symbol, but different ISO currency symbols.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-9 NLS_ISO_CURRENCY

1. Note the current values of NLS_TERRITORY and NLS_ISO_CURRENCY.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the value of NLS_TERRITORY in step 1 is not AUSTRALIA, change it:

```
ALTER SESSION SET NLS_TERRITORY=AUSTRALIA;
```

3. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Local",
       TO_CHAR(salary, 'C099G999D99') "ISO"
FROM EMPLOYEES
WHERE salary > 15000;
```

Result:

Local	ISO
\$024,000.00	AUD024,000.00
\$017,000.00	AUD017,000.00
\$017,000.00	AUD017,000.00

4. Change the value of NLS_TERRITORY to AMERICA:

```
ALTER SESSION SET NLS_TERRITORY=AMERICA;
```

5. Run this query:

```
SELECT TO_CHAR(salary, 'L099G999D99') "Local",
       TO_CHAR(salary, 'C099G999D99') "ISO"
FROM EMPLOYEES
WHERE salary > 15000;
```

Result:

Local	ISO
\$024,000.00	USD024,000.00
\$017,000.00	USD017,000.00
\$017,000.00	USD017,000.00

6. Set NLS_TERRITORY and NLS_ISO_CURRENCY to the values that they had at step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_ISO_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_DUAL_CURRENCY Parameter

Specifies: Dual currency symbol (introduced to support the euro currency symbol during the euro transition period).

Acceptable Values: Any valid currency symbol string.

Default Value: Set by NLS_TERRITORY, described in ["About the NLS_TERRITORY Parameter"](#) on page 9-12.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_DUAL_CURRENCY parameter
- ["About Numeric and Monetary Formats"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_SORT Parameter

Specifies: Linguistic sort order (collating sequence) for queries that have the ORDER BY clause.

Acceptable Values:

- BINARY

Sort order is based on the binary sequence order of either the database character set or the national character set, depending on the data type.

- Any linguistic sort name that Oracle supports

Sort order is based on the order of the specified linguistic sort name. The linguistic sort name is usually the same as the language name, but not always. For a list of supported linguistic sort names, see *Oracle Database Globalization Support Guide*.

Default Value: Set by NLS_LANGUAGE, described in ["About the NLS_LANGUAGE Parameter"](#) on page 9-10.

[Example 9-10](#) shows how two different NLS_SORT settings affect the displayed result of the same query. The settings are BINARY and Traditional Spanish (SPANISH_M). Traditional Spanish treats ch, ll, and ñ as letters that follow c, l, and n, respectively.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-10 NLS_SORT Affects Linguistic Sort Order

1. Create table for Spanish words:

```
CREATE TABLE temp (name VARCHAR2(15));
```

2. Populate table with some Spanish words:

```
INSERT INTO temp (name) VALUES ('laguna');
INSERT INTO temp (name) VALUES ('llama');
INSERT INTO temp (name) VALUES ('loco');
```

3. Note the current value of NLS_SORT.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

4. If the value of `NLS_SORT` in step 3 is not `BINARY`, change it:

```
ALTER SESSION SET NLS_SORT=BINARY;
```

5. Run this query:

```
SELECT * FROM temp ORDER BY name;
```

Result:

```
NAME
-----
laguna
llama
loco
```

6. Change the value of `NLS_SORT` to `SPANISH_M` (Traditional Spanish):

```
ALTER SESSION SET NLS_SORT=SPANISH_M;
```

7. Repeat the query from step 5.

Result:

```
NAME
-----
laguna
loco
llama
```

8. Drop the table:

```
DROP TABLE temp;
```

9. Set `NLS_SORT` to the value that it had at step 3.

Case-Insensitive and Accent-Insensitive Sorts

Operations inside Oracle Database are sensitive to the case and the accents of the characters. To perform a case-insensitive sort, append `_CI` to the value of the `NLS_SORT` parameter (for example, `BINARY_CI` or `XGERMAN_CI`). To perform a sort that is both case-insensitive and accent-insensitive, append `_AI` to the value of the `NLS_SORT` parameter (for example, `BINARY_AI` or `FRENCH_M_AI`).

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_SORT` parameter
- *Oracle Database Globalization Support Guide* for more information about case-insensitive and accent-insensitive sorts
- ["About Linguistic Sorting and String Searching"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the `NLS_COMP` Parameter

Specifies: Character comparison behavior of SQL operations.

Acceptable Values:

- `BINARY`

SQL compares the binary codes of characters. One character is greater than another if it has a higher binary code.

- LINGUISTIC

SQL performs a linguistic comparison based on the value of the `NLS_SORT` parameter, described in ["About the NLS_SORT Parameter"](#) on page 9-23.

- ANSI

This value is provided only for backward compatibility.

Default Value: BINARY

[Example 9-11](#) shows that the result of a query can depend on the `NLS_COMP` setting.

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-11 NLS_COMP Affects SQL Character Comparison

1. Note the current values of `NLS_SORT` and `NLS_COMP`.

For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.

2. If the values of `NLS_SORT` and `NLS_COMP` in step 1 are not `SPANISH_M` (Traditional Spanish) and `BINARY`, respectively, change them:

```
ALTER SESSION SET NLS_SORT=SPANISH_M NLS_COMP=BINARY;
```

3. *Run this query:

```
SELECT LAST_NAME FROM EMPLOYEES
WHERE LAST_NAME LIKE 'C%';
```

Result:

```
LAST_NAME
-----
Cabrio
Cambrault
Cambrault
Chen
Chung
Colmenares

6 rows selected
```

4. Change the value of `NLS_COMP` to `LINGUISTIC`:

```
ALTER SESSION SET NLS_COMP=LINGUISTIC;
```

5. Repeat the query from step 3.

Result:

```
LAST_NAME
-----
Cabrio
Cambrault
Cambrault
Colmenares
```

4 rows selected

This time, Chen and Chung are not returned because Traditional Spanish treats ch as a single character that follows c.

6. Set NLS_SORT and NLS_COMP to the values that they had in step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the NLS_COMP parameter
- ["About Linguistic Sorting and String Searching"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

About the NLS_LENGTH_SEMANTICS Parameter

Specifies: Length semantics for columns of the character data types CHAR, VARCHAR2, and LONG; that is, whether these columns are specified in bytes or in characters. (Applies only to columns that are declared after the parameter is set.)

Acceptable Values:

- BYTE
New CHAR, VARCHAR2, and LONG columns are specified in bytes.
- CHAR
New CHAR, VARCHAR2, and LONG columns are specified in characters.

Default Value: BYTE

To try this example in SQL Developer, enter the statements and queries in the SQL Worksheet. For information about the SQL Worksheet, see ["Running Queries in SQL Developer"](#) on page 4-2. The results shown here are from SQL*Plus; their format is slightly different in SQL Developer.

Example 9-12 NLS_LENGTH_SEMANTICS Affects Storage of VARCHAR2 Column

1. Note the current values of NLS_LENGTH_SEMANTICS.
For instructions, see ["Viewing NLS Parameter Values"](#) on page 9-6.
2. If the value of NLS_LENGTH_SEMANTICS in step 1 is not BYTE, change it:

```
ALTER SESSION SET NLS_LENGTH_SEMANTICS=BYTE;
```

3. Create a table with a VARCHAR2 column:

```
CREATE TABLE SEMANTICS_BYTE(SOME_DATA VARCHAR2(20));
```
4. Click the tab **Connections**.
The Connections pane shows the connection hr_conn.
5. Expand **hr_conn**.
A list of schema object types appears, including Tables.
6. Expand **Tables**.
A list of tables appears, including SEMANTICS_BYTE.

7. Select **SEMANTICS_BYTE**.

To the right of the Connections pane, the Columns pane shows that for Column Name `SOME_DATA`, the Data Type is `VARCHAR2(20 BYTE)`.

8. Change the value of `NLS_LENGTH_SEMANTICS` to `CHAR`:

```
ALTER SESSION SET NLS_LENGTH_SEMANTICS=CHAR;
```

9. Create another table with a `VARCHAR2` column:

```
CREATE TABLE SEMANTICS_CHAR(SOME_DATA VARCHAR2(20));
```

10. In the Connections pane, click the **Refresh icon**.

The list of tables now includes `SEMANTICS_CHAR`.

11. Select **SEMANTICS_CHAR**.

The Columns pane shows that for Column Name `SOME_DATA`, the Data Type is `VARCHAR2(20 CHAR)`.

12. Select **SEMANTICS_BYTE** again.

The Columns pane shows that for Column Name `SOME_DATA`, the Data Type is still `VARCHAR2(20 BYTE)`.

13. Set the value of `NLS_LENGTH_SEMANTICS` to the value that it had in step 1.

See Also:

- *Oracle Database Globalization Support Guide* for more information about the `NLS_LENGTH_SEMANTICS` parameter
- ["About Length Semantics"](#) on page 9-4
- ["Changing NLS Parameter Values"](#) on page 9-7

Using Unicode in Globalized Applications

You can insert and retrieve Unicode data. Data is transparently converted among the database and client programs, which ensures that client programs are independent of the database character set and national character set.

Topics:

- [Representing Unicode String Literals in SQL and PL/SQL](#)
- [Avoiding Data Loss During Character-Set Conversion](#)

See Also:

- *Oracle Database Globalization Support Guide* for more information about SQL and PL/SQL programming with Unicode
- *Oracle Database Globalization Support Guide* for general information about programming with Unicode

Representing Unicode String Literals in SQL and PL/SQL

There are three ways to represent a Unicode string literal in SQL or PL/SQL:

- `N'string'`

Example: `N'résumé'`.

Limitations: See ["Avoiding Data Loss During Character-Set Conversion"](#) on page 9-28.

- `NCHR (number)`

The SQL function `NCHR` returns the character whose binary equivalent is *number* in the national character set. The character returned has data type `NVARCHAR2`.

Example: `NCHR(36)` represents \$ in the default national character set, AL16UTF16.

Limitations: Portability of the value of `NCHR (number)` is limited to applications that use the same national character set.

- `UNISTR ('string')`

The SQL function `UNISTR` converts *string* to the national character set.

For portability and data preservation, Oracle recommends that *string* contain only ASCII characters and Unicode encoding values. A Unicode encoding value has the form `\xxxx`, where `xxxx` is the hexadecimal value of a character code value in UCS-2 encoding format.

Example: `UNISTR('G\0061ry')` represents 'Gary'

ASCII characters are converted to the database character set and then to the national character set. Unicode encoding values are converted directly to the national character set.

See Also:

- *Oracle Database Globalization Support Guide* for more information about Unicode string literals
- *Oracle Database SQL Language Reference* for more information about the `NCHR` function
- *Oracle Database SQL Language Reference* for more information about the `UNISTR` function

Avoiding Data Loss During Character-Set Conversion

As part of a SQL or PL/SQL statement, a literal (with or without the prefix `N`) is encoded in the same character set as the rest of the statement. On the client side, the statement is encoded in the client character set, which is determined by the `NLS_LANG` parameter. On the server side, the statement is encoded in the database character set.

When the SQL or PL/SQL statement is transferred from the client to the database, its character set is converted accordingly. If the database character set does not contain all characters that the client used in the text literals, then data is lost in this conversion. `NCHAR` string literals are more vulnerable than `CHAR` text literals, because they are designed to be independent of the database character set.

To avoid data loss in conversion to an incompatible database character set, you can activate the `NCHAR` literal replacement functionality. For more information, see *Oracle Database Globalization Support Guide*.

Deploying an Oracle Database Application

This chapter contains the following topics:

- [About Deployment Environments](#)
- [About Installation Script Files](#)
- [Creating Installation Script Files](#)
- [Installing the Sample Application](#)
- [Checking the Validity of an Installation](#)
- [Archiving the Installation Script Files](#)

About Deployment Environments

Deployment is installing your application in one or more environments where other users can run it.

The schema in which you develop your application is called the **development environment**. (The development environment for the sample application is the sample schema HR.) The other environments in which you deploy your application are called **deployment environments**. These environments might exist in your organization; if not, you can create them.

The first deployment environment is the **test environment**. In the test environment, you can thoroughly test the functionality of the application, determine whether it is packaged correctly, and fix any problems before deploying it in the **production environment**.

You might also deploy your application to an **education environment**, either before or after deploying it to the production environment. An education environment provides a place for users to practice running the application without affecting other environments.

About Installation Script Files

To deploy an application, you run one or more installation script files. If these files do not exist, you can create them, with SQL Developer or any text editor.

An **installation script file** is an executable file (.sql file) that contains an installation script. An **installation script** is composed of DDL statements, INSERT statements, or both. When you run your installation script files, the DDL statements create the schema objects of your application in the deployment environment, and the INSERT statements insert the data from the tables in your development environment (the

source tables) into the corresponding tables in the deployment environment (the **new tables**).

Topics:

- [About DDL Statements and Schema Object Dependencies](#)
- [About INSERT Statements and Constraints](#)

About DDL Statements and Schema Object Dependencies

When you run your installation script files, their DDL statements create the schema objects of your application in the deployment environment. To create the installation script files correctly and run them in the correct order, you must understand the dependencies between the schema objects of your application.

If the definition of object A references object B, then A depends on B. Therefore, you must create B before you create A. Otherwise, the statement that creates B either fails or creates B in an invalid state, depending on the object type.

Typically, you install schema objects and data in the deployment environment in this order:

1. Package specifications
2. Tables (with constraints and indexes) in correct order
3. Sequences (often used by triggers)
4. Triggers
5. Synonyms
6. Views (which might reference functions, procedures, or synonyms)
7. Package bodies
8. Data

However, for a complex application, the order for creating the objects is rarely obvious. Usually, you must consult the database designer or a diagram of the design.

See Also:

- *Oracle Database Advanced Application Developer's Guide* for more information about schema object dependencies
- ["About Data Definition Language \(DDL\) Statements"](#) on page 6-1

About INSERT Statements and Constraints

When you run your installation script files, their `INSERT` statements insert the data from the source tables into the corresponding new tables. For each source table in your application, you must determine whether any constraints could be violated when their data is inserted in the new table. If so, you must first disable those constraints, then insert the data, and then try to re-enable the constraints. If a data item violates a constraint, you cannot re-enable that constraint until you correct the data item.

If you are simply inserting lookup data in correct order, constraints are not violated. Therefore, you do not need to disable them first.

If you are inserting data from an outside source (such as a file, spreadsheet, or older application), or from many tables that have much dependent data, disable the constraints before inserting the data.

Some possible ways to disable and re-enable the constraints are:

- Using SQL Developer, disable and re-enable the constraints one at a time.
- Edit the installation script file, adding SQL statements that disable and re-enable each constraint.
- Create a SQL script with SQL statements that disable and enable each constraint.
- Find the constraints in the Oracle Database data dictionary, and create a SQL script with the SQL statements to disable and enable each constraint.

To find and enable the constraints used in the EVALUATIONS, PERFORMANCE_PARTS, and SCORES tables, enter these statements into a SQL Worksheet window:

```
SELECT 'ALTER TABLE ' || TABLE_NAME || ' DISABLE CONSTRAINT ' ||
CONSTRAINT_NAME || ';'
FROM user_constraints
WHERE table_name IN ('EVALUATIONS', 'PERFORMANCE_PARTS', 'SCORES');

SELECT 'ALTER TABLE ' || TABLE_NAME || ' ENABLE CONSTRAINT ' ||
CONSTRAINT_NAME || ';'
FROM user_constraints
WHERE table_name IN ('EVALUATIONS', 'PERFORMANCE_PARTS', 'SCORES');
```

Creating Installation Script Files

This topic explains how to use SQL Developer to create an installation script file, when and how to edit installation script files that create sequences and triggers, and how to create installation script files for the schema objects and data of the sample application.

The tutorials in this topic assume that you created the objects in the sample schema HR, using the instructions in this document, and are deploying the sample application in another standard HR schema.

Note: To do the tutorials in this document, you must be connected to Oracle Database as the user HR from SQL Developer. For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer" on page 2-6](#).

Topics:

- [Creating an Installation Script File with SQL Developer](#)
- [Editing Installation Script Files that Create Sequences](#)
- [Editing Installation Script Files that Create Triggers](#)
- [Tutorial: Creating an Installation Script File for the Sequence and Tables](#)
- [Tutorial: Creating an Installation Script File for the Package](#)
- [Tutorial: Creating an Installation Script File for the Synonym and View](#)
- [Tutorial: Creating an Installation Script File for the Data](#)

Creating an Installation Script File with SQL Developer

To create an installation script file with SQL Developer, use the Database Export tool. You specify the name of the installation script file and the objects and data to export, and SQL Developer generates DDL statements for creating the objects and `INSERT` statements for inserting the data into new tables, and writes these statements to the installation script file.

Note: In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script file with the Database Export tool:

1. If you have not done so, create a directory for the installation script file, separate from the Oracle Database installation directory (for example, `C:\my_exports`).
2. In the SQL Developer window, click the menu **Tools**.
A drop-down menu appears.
3. From drop-down menu, select **Database Export**.
The Source/Destination window opens.
4. In the Source/Destination window:
 1. In the File field, type the full path name of the installation script file (for example, `C:\my_exports\hr_export.sql`).
The file name must end with `.sql`.
 2. From the Connections drop-down menu, select your connection (for example, `hr_conn`).
 3. Select the desired DDL Options (and deselect any selected undesired options).
By default, Terminator and Pretty Print are selected and all other options are deselected. If you deselect Terminator, the installation script file fails.
For descriptions of the DDL Options, see *Oracle Database SQL Developer User's Guide*.
 4. Click **Next**.
The Types to Export window appears, listing the types of objects, and data, that you can export. To the left of each object is a check box. By default, every check box is selected.
5. In the Types to Export window:
 1. Deselect the check boxes for the types that you do *not* want to export.
Selecting or deselecting Toggle All selects or deselects all check boxes.
 2. If you do not want to export data, deselect the check box **Data**.
 3. Click **Next**.
The Specify Objects window appears.
6. In the Specify Objects window:
 1. In the drop-down menu with the value `HR`, accept that value.
 2. Click **Go**.

A list appears, showing all objects in schema `HR` whose types you specified in step 5, and, if you specified Data in step 5, names of tables in schema `HR`.

3. To export all items on the list, click `>>`; otherwise, select the objects to export and the tables with data to export, and click `>`.

The items to be exported move from the original column to the other column. (To move all of them back to the original column, click `<<`; to move individual items back, select them and click `<`.)

4. Click **Next**.

The Export Summary window appears.

7. In the Export Summary window, click **Finish**.

The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the SQL Worksheet shows the contents of the installation script file that you specified in step 4.

8. In the installation script file, check that:

- Referenced objects are created before their dependent objects.
- Tables are created before data is inserted into them.

If necessary, edit the file in the SQL Worksheet or any text editor.

- ["Tutorial: Creating an Installation Script File for the Synonym and View"](#) on page 10-9
- ["Tutorial: Creating an Installation Script File for the Data"](#) on page 10-11

Editing Installation Script Files that Create Sequences

For a sequence, SQL Developer generates a `CREATE SEQUENCE` statement whose `START WITH` value is relative to the current value of the sequence in the development environment.

If your application uses the sequence to generate unique keys, and you *will not* insert the data from the source tables into the corresponding new tables, then you might want to edit the `START WITH` value in the installation script file. You can edit the installation script file in the SQL Worksheet or any text editor.

See Also: ["Tutorial: Creating a Sequence"](#) on page 6-21

Editing Installation Script Files that Create Triggers

If your application has a `BEFORE INSERT` trigger on a source table, and you *will* insert the data from that source table into the corresponding new table, then you must decide if you want the trigger to fire before each `INSERT` statement in the installation script file inserts data into the new table.

For example, in the sample application, `NEW_EVALUATION_TRIGGER` fires before a row is inserted into the `EVALUATIONS` table, and generates the unique number for the primary key of that row, using `EVALUATIONS_SEQ`. The trigger fires once for each row affected by the triggering `INSERT` statement. (`NEW_EVALUATION_TRIGGER` is created in "[Tutorial: Creating a Trigger that Generates a Primary Key for a Row Before It Is Inserted](#)" on page 8-4.)

The source `EVALUATIONS` table is populated with primary keys. If you do not want the installation script to put new primary key values in the new `EVALUATIONS` table, then you must edit the `CREATE TRIGGER` statement in the installation script file as shown in bold:

```
CREATE OR REPLACE
TRIGGER NEW_EVALUATION_TRIGGER
BEFORE INSERT ON EVALUATIONS
FOR EACH ROW
BEGIN
    IF :NEW.evaluation_id IS NULL THEN
        :NEW.evaluation_id := evaluations_seq.NEXTVAL
    END IF;
END;
```

Also, check the current value of the sequence. If it not is greater than the maximum value in the primary key column, make it greater.

You can edit the installation script file in the SQL Worksheet or any text editor.

Two alternatives to editing the installation script file are:

- Change the trigger definition in the source file and then re-create the installation script file.

For information about changing triggers, see "[Changing Triggers](#)" on page 8-7.

- Disable the trigger before running the data installation script file, and then re-enable it afterward.

For information about disabling and enabling triggers, see "[Disabling and Enabling Triggers](#)" on page 8-7.

See Also: "[Creating Triggers](#)" on page 8-2

Tutorial: Creating an Installation Script File for the Sequence and Tables

This tutorial shows how to use the SQL Developer tool Database Export to create an installation script file for the tables and sequence of the sample application, including the constraints, indexes, and triggers associated with the tables.

Note: In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script file for the tables and sequence:

1. If you have not done so, create the directory `C:\my_exports`.

2. In the SQL Developer window, click the menu **Tools**.

A drop-down menu appears.

3. From drop-down menu, select **Database Export**.

The Source/Destination window opens.

4. In the Source/Destination window:

1. In the File field, type: `C:\my_exports\2day_tables.sql`.
2. From the Connections drop-down menu, select **hr_conn**.
3. Accept the default DDL Options, Terminator and Pretty Print.
4. Click **Next**.

The Types to Export window appears.

5. In the Types to Export window:

1. Deselect all check boxes *except* Tables, Sequences, Indexes, Constraints, and Triggers.
2. Click **Next**.

The Specify Objects window appears.

6. In the Specify Objects window:

1. In the drop-down menu with the value **HR**, accept that value.
2. In the drop-down menu with the value **All**, select the value **TABLE**.
3. Click **Go**.

A list of the tables in schema **HR** appears.

4. Select **HR.PERFORMANCE_PARTS**, **HR.EVALUATIONS**, **HR.SCORES**, and **HR.EVALUATIONS_LOG**.
5. Click **>**.

The selected tables move from the original column to the other column.

6. In the drop-down menu with the value **TABLE**, select the value **SEQUENCE**.
7. Click **Go**.

A list of the sequences in schema **HR** appears.

8. Select **HR.EVALUATIONS_SEQ**.
9. Click **>**.

HR.EVALUATIONS_SEQ moves from the original column to the other column.

10. (Optional) In the drop-down menu with the value **SEQUENCE**, select the value **All**.

HR.PERFORMANCE_PARTS, **HR.EVALUATIONS**, **HR.SCORES**, **HR.EVALUATIONS_LOG** and **HR.EVALUATIONS_SEQ** show.

11. Click **Next**.

The Export Summary window appears.

7. In the Export Summary window, click **Finish**.

The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the SQL Worksheet shows the contents of the file `C:\my_exports\2day_tables.sql`.

8. In the installation script file, `C:\my_exports\2day_tables.sql`, check that referenced objects are created before their dependent objects:
 - The sequence `EVALUATIONS_SEQ` must be created before the table `EVALUATIONS`, because `EVALUATIONS` has a trigger, `NEW_EVALUATION_TRIGGER`, that uses `EVALUATIONS_SEQ`.
 - The table `EVALUATIONS_LOG` must be created before the table `EVALUATIONS`, because `EVALUATIONS` has a trigger, `EVAL_CHANGE_TRIGGER`, that uses `EVALUATIONS_LOG`.
 - The tables `EVALUATIONS` and `PERFORMANCE_PARTS` must be created before the table `SCORES`, because `SCORES` has foreign keys to both `EVALUATIONS` and `PERFORMANCE_PARTS`.

If necessary, edit the file in the SQL Worksheet or any text editor.

See Also:

- ["Creating Tables"](#) on page 6-3
- ["Tutorial: Creating a Sequence"](#) on page 6-21

Tutorial: Creating an Installation Script File for the Package

This tutorial shows how to use the SQL Developer tool Database Export to create an installation script file for the package (specification and body) of the sample application.

Note: In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script file for the package:

1. If you have not done so, create the directory `C:\my_exports`.
2. In the SQL Developer window, click the menu **Tools**.
A drop-down menu appears.
3. From drop-down menu, select **Database Export**.
The Source/Destination window opens.
4. In the Source/Destination window:
 1. In the File field, type: `C:\my_exports\2day_package.sql`.
 2. From the Connections drop-down menu, select **hr_conn**.
 3. Accept the default DDL Options, Terminator and Pretty Print.
 4. Click **Next**.The Types to Export window appears.
5. In the Types to Export window:

1. Deselect all check boxes *except* Package Spec and Package Body.
2. Click **Next**.

The Specify Objects window appears.

6. In the Specify Objects window:

1. In the drop-down menu with the value HR, accept that value.
2. In the drop-down menu with the value All, accept that value.
3. Click **Go**.

A list of the packages and package bodies in schema HR appears.

4. If the only items listed are the package HR.EMP_EVAL and the package body HR.EMP_EVAL, click >>; otherwise, select those two items from the list and click >.

The package HR.EMP_EVAL and the package body HR.EMP_EVAL move from the original column to the other column.

5. Click **Next**.

The Export Summary window appears.

7. In the Export Summary window, click **Finish**.

The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the SQL Worksheet shows the contents of the installation script file that you specified in step 4.

See Also:

- ["Tutorial: Creating a Package Specification"](#) on page 7-12

Tutorial: Creating an Installation Script File for the Synonym and View

This tutorial shows how to use the SQL Developer tool Database Export to create an installation script file for the synonym and view of the sample application.

Note: In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script file for the synonym and view:

1. If you have not done so, create the directory C:\my_exports.
2. In the SQL Developer window, click the menu **Tools**.
A drop-down menu appears.
3. From drop-down menu, select **Database Export**.
The Source/Destination window opens.
4. In the Source/Destination window:
 1. In the File field, type: C:\my_exports\2day_other.sql.
 2. From the Connections drop-down menu, select **hr_conn**.

3. Accept the default DDL Options, Terminator and Pretty Print.
4. Click **Next**.
The Types to Export window appears.
5. In the Types to Export window:
 1. Deselect all check boxes *except* Views and Synonyms.
 2. Click **Next**.
The Specify Objects window appears.
6. In the Specify Objects window:
 1. In the drop-down menu with the value `HR`, accept that value.
 2. In the drop-down menu with the value `All`, select the value **VIEW**.
 3. Click **Go**.
A list of the views in schema `HR` appears.
 4. Select `HR.EMP_LOCATIONS`.
 5. Click **>**.
`HR.EMP_LOCATIONS` moves from the original column to the other column.
 6. In the drop-down menu with the value `VIEW`, select the value **SYNONYM**.
 7. Click **Go**.
A list of the synonyms in schema `HR` appears.
 8. Select `HR.EMP`.
 9. Click **>**.
`HR.EMP` moves from the original column to the other column.
 10. (Optional) In the drop-down menu with the value `SYNONYM`, select the value **All**.
`HR.EMP_LOCATIONS` and `HR.EMP` show.
 11. Click **Next**.
The Export Summary window appears.
7. In the Export Summary window, click **Finish**.
The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the SQL Worksheet shows the contents of the file `C:\my_exports\2day_other.sql`.

Tutorial: Creating an Installation Script File for the Data

This tutorial shows how to use the SQL Developer tool Database Export to create an installation script file for the data of the sample application. If you followed the instructions in this document, you added data only to the table `PERFORMANCE_PARTS`.

Note: In the following procedure, you might have to enlarge the SQL Developer windows to see all fields and options.

To create an installation script file for the data:

1. If you have not done so, create the directory `C:\my_exports`.
2. In the SQL Developer window, click the menu **Tools**.
A drop-down menu appears.
3. From drop-down menu, select **Database Export**.
The Source/Destination window opens.
4. In the Source/Destination window:
 1. In the File field, type: `C:\my_exports\2day_data.sql`.
 2. From the Connections drop-down menu, select **hr_conn**.
 3. Accept the default DDL Options, Terminator and Pretty Print.
 4. Click **Next**.The Types to Export window appears.
5. In the Types to Export window:
 1. Deselect all check boxes *except* Data.
 2. Click **Next**.The Specify Data window appears.
6. In the Specify Data window:
 1. In the drop-down menu with the value **HR**, accept that value.
 2. Click **Go**.
A list of the tables in schema **HR** appears.
 3. Select **HR.PERFORMANCE_PARTS**.
 4. Click **>**.
`HR.PERFORMANCE_PARTS` moves from the original column to the other column.
 5. Click **Next**.
The Export Summary window appears.
7. In the Export Summary window, click **Finish**.
The Exporting window opens, showing that exporting is occurring. When exporting is complete, the Exporting window closes, and the SQL Worksheet shows the contents of the file `C:\my_exports\2day_data.sql`.

See Also:

- ["About the INSERT Statement"](#) on page 5-2
- ["Creating an Installation Script File with SQL Developer"](#) on page 10-4

Installing the Sample Application

To install the sample application, you run the installation script files that you created in the tutorials in ["Creating Installation Script Files"](#) on page 10-3, in this order:

1. 2day_tables.sql
2. 2day_package.sql
3. 2day_other.sql
4. 2day_data.sql

You can either run the files one at a time, or you can create and run a master SQL script file that runs them in order.

The following master SQL script runs the files in order, commits the changes, and writes server messages to a log file:

```
spool C:\my_exports\create_log.txt
@C:\my_exports\2day_tables.sql
@C:\my_exports\2day_package.sql
@C:\my_exports\2day_other.sql
@C:\my_exports\2day_data.sql
commit;
spool off
```

The SQL*Plus command `@file_name.sql` runs a file.

Typically, you run the master script file in SQL*Plus. However, if the master script specifies the full path names of the individual files (as in the preceding example), you can run it in SQL Developer.

The following procedure uses SQL Developer to install the sample application by running the installation script files one at a time, in order.

Note: The deployment environment must be different from the development environment, and is assumed to be another standard HR schema.

To install the sample application using SQL Developer:

1. Connect to Oracle Database as user HR in the deployment environment.

For instructions, see ["Connecting to Oracle Database as User HR from SQL Developer"](#) on page 2-6. For Connection Name, enter a name other than hr_conn (for example, hr_conn_2).

2. In the navigation frame, click the tab **Files**.

The Files pane appears, showing the directories on your computer.

3. Navigate to the directory C:\my_exports.

4. Expand **my_exports**.

The list of installation script files appears.

5. Right-click **2day_tables.sql**.

A list of choices appears.

6. Select **Open**.

In the SQL Worksheet, a new `2day_tables.sql` pane appears, showing the content of the `2day_tables.sql` file.

7. Click the icon **Run Script**.

The Select Connection window opens.

8. For Connection, on the drop-down menu, select the connection to the deployment environment (created in step 1).

9. Click **OK**.

The result of each statement in `2day_tables.sql` is displayed in the Script Output pane.

10. Click the icon **Clear**.

The title of the `2day_tables.sql` pane is now in italic font, indicating that the changes have not been committed, and the SQL Worksheet is blank.

11. Repeat steps 5 through 10 for `2day_package.sql`.

12. Repeat steps 5 through 10 for `2day_other.sql`.

13. Repeat steps 5 through 10 for `2day_data.sql`.

14. Click the icon **Commit**.

The changes are committed.

When you are sure that the individual installation script files run without errors, you can create a master SQL script (`.sql`) file that runs them in order, commits the changes, and writes the results to a log file. For example:

```
spool C:\my_exports\create_log.txt
@C:\my_exports\2day_tables.sql
@C:\my_exports\2day_package.sql
@C:\my_exports\2day_other.sql
@C:\my_exports\2day_data.sql
commit;
spool off
```

Typically, you run the master file in SQL*Plus. However, if the master file specifies the full path names of the individual files (as in the preceding example), you can open and run it in SQL Developer.

- *SQL*Plus User's Guide and Reference* for more information about using scripts in SQL*Plus

Checking the Validity of an Installation

After installing your application in a deployment environment, you can check its validity in the following ways in SQL Developer:

- In the Connections pane:

1. Expand the connection to the deployment environment.
 2. Examine the definitions of the new objects.
 - In the Reports pane:
 1. Expand **Data Dictionary Reports**.
A list of data dictionary reports appears.
 2. Expand **All Objects**.
A list of objects reports appears.
 3. Select **All Objects**.
 4. Click the icon **Run Report**.
The Enter Bind Values window appears.
 5. Select either **Owner** or **Object**.
 6. Click **Apply**.
The message "Executing Report" shows, followed by the report itself.
For each object, this report lists the Owner, Object Type, Object Name, Status (Valid or Invalid), Date Created, and Last DDL. Last DDL is the date of the last DDL operation that affected the object.
 7. Select **Invalid Objects**.
The Enter Bind Values window appears.
 8. Click **Apply**.
The message "Executing Report" shows, followed by the report itself.
For each object whose Status is Invalid, this report lists the Owner, Object Type, and Object Name.
- See Also:** *Oracle Database SQL Developer User's Guide* for more information about SQL Developer reports

Archiving the Installation Script Files

After verifying that the installation of your application is valid, you might want to archive your installation script files in a source code control system. Before doing so, add comments to each file, documenting its creation date and purpose. If you ever must deploy the same application to another environment, you can use these archived files.

See Also: *Oracle Database Utilities* for information about Oracle Data Pump, which enables very high-speed movement of data and metadata from one database to another
